

**M.Sc. I.T. Semester II MODERN
NETWORKING (PSIT2P2)**

List of Practical

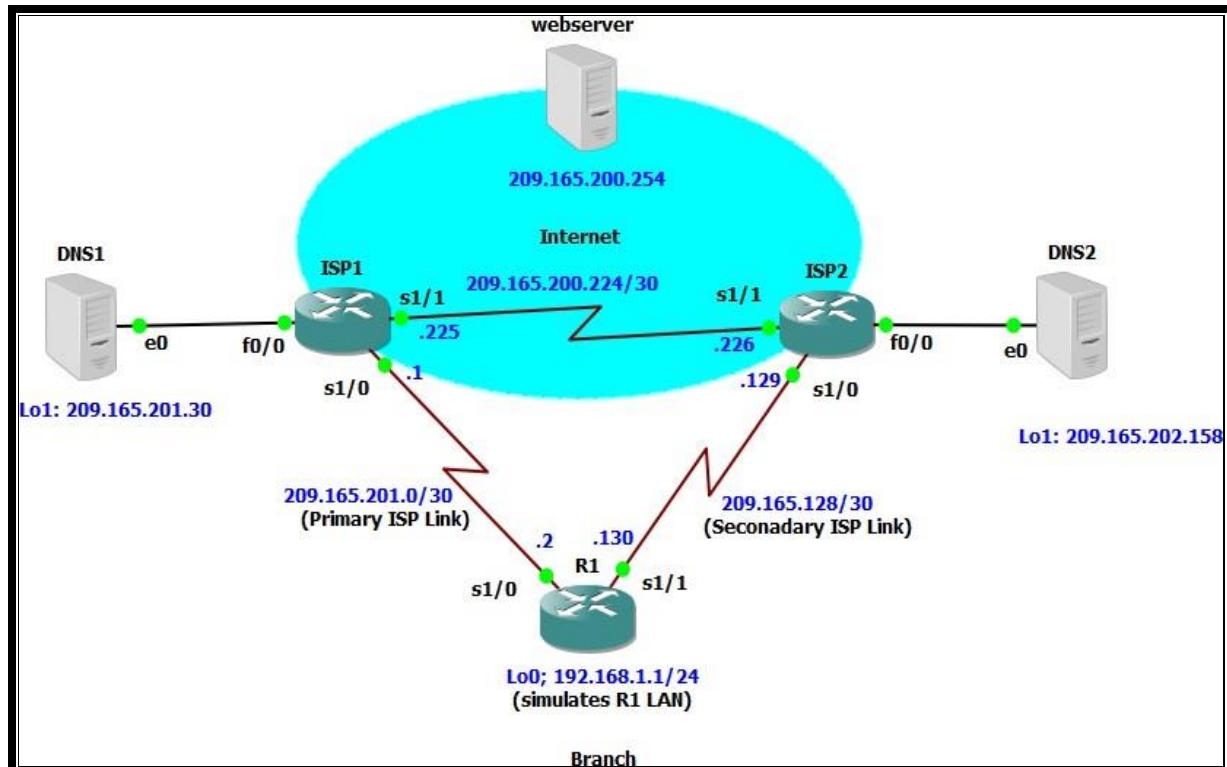

All practical's are expected to be performed on GNS3/EVE-Ng networkEmulator/MININET

No	Title of Practical	Date	Pg No.	Signature
1	Configure IP SLA Tracking and Path Control Topology		1	
2	Using the AS_PATH Attribute		11	
3	Configuring IBGP and EBGP Sessions, Local Preference, and MED		19	
4	Secure the Management Plane		36	
5	Configure and Verify Path Control Using PBR		48	
6	IP Service Level Agreements and Remote SPAN in a Campus Environment		60	
7	Inter-VLAN Routing		73	

Practical No – 1

Aim: Configure IP SLA Tracking and Path ControlTopology .

Topolgy :

Objectives:

- Configure and verify the IP SLA feature.
- Test the IP SLA tracking feature.
- Verify the configuration and operation using **show** and **debug** commands.

Required Resources

- 3 routers (Cisco IOS Release 15.2 or comparable)
- Serial and Ethernet cables

Step 1: Prepare the routers and configure the router hostname and interface addresses.

- Cable the network as shown in the topology diagram

Router R1

hostname R1

```
interface Loopback 0
description R1 LAN
ip address 192.168.1.1 255.255.255.0
interface Serial0/0
description R1 --> ISP1
ip address 209.165.201.2 255.255.255.252
```

```

clock rate 128000
bandwidth 128
no shutdown

interface Serial0/1
description R1 --> ISP2
ip address 209.165.202.130 255.255.255.252
bandwidth 128
no shutdown

```

```

R1(config-if) # description R1 --> ISP1
R1(config-if) # ip address 209.165.201.2 255.255.255.252
R1(config-if) # clock rate 128000
R1(config-if) # bandwidth 128
R1(config-if) # no shutdown
R1(config-if) #
*May 18 22:36:18.375: %LINK-3-UPDOWN: Interface Serial4/0, changed sta
R1(config-if) #
*May 18 22:36:19.383: %LINEPROTO-5-UPDOWN: Line protocol on Interface
    changed state to up
R1(config-if) #
*May 18 22:36:45.791: %LINEPROTO-5-UPDOWN: Line protocol on Interface
    changed state to down
R1(config-if) #interface Serial4/1
R1(config-if) # description R1 --> ISP2
R1(config-if) # ip address 209.165.202.130 255.255.255.252
R1(config-if) # bandwidth 128
R1(config-if) # no shutdown
R1(config-if) #
*May 18 22:37:14.415: %LINK-3-UPDOWN: Interface Serial4/1, changed sta
R1(config-if) #
*May 18 22:37:15.423: %LINEPROTO-5-UPDOWN: Line protocol on Interface
    changed state to up
R1(config-if) #

```

Router ISP1 (R2)

```

hostname ISP1
interface Loopback0
description Simulated Internet Web Server
ip address 209.165.200.254 255.255.255.255

```

```

interface Loopback1
description ISP1 DNS Server
ip address 209.165.201.30 255.255.255.255
interface Serial0/0/0
description ISP1 --> R1
ip address 209.165.201.1 255.255.255.252
bandwidth 128
no shutdown

```

```

interface Serial0/0/1
description ISP1 --> ISP2
ip address 209.165.200.225 255.255.255.252
clock rate 128000
bandwidth 128
no shutdown

```

```

R2(config-if) # no shutdown
*May 18 22:40:10.467: %LINK-3-UPDOWN: Interface Serial4/0, chan
R2(config-if) # no shutdown
*May 18 22:40:11.471: %LINEPROTO-5-UPDOWN: Line protocol on Int
    changed state to up
R2(config-if) # no shutdown
R2(config-if) #
*May 18 22:40:22.055: %LINK-3-UPDOWN: Interface Serial4/1, chan
R2(config-if) #
*May 18 22:40:23.059: %LINEPROTO-5-UPDOWN: Line protocol on Int
    changed state to up
R2(config-if) # █

```

Router ISP2 (R3)

```

hostname ISP2
interface Loopback0
description Simulated Internet Web Server
ip address 209.165.200.254 255.255.255.255

```

```

interface Loopback1
description ISP2 DNS Server
ip address 209.165.202.158 255.255.255.255
interface Serial0/0/0
description ISP2 --> R1
ip address 209.165.202.129 255.255.255.252
clock rate 128000
bandwidth 128
no shutdown

```

```

interface Serial0/0/1
description ISP2 --> ISP1
ip address 209.165.200.226 255.255.255.252
bandwidth 128
no shutdown

```

```

R3(config-if) # bandwidth 128
R3(config-if) # no shutdown
*May 18 22:43:08.039: %LINEPROTO-5-UPDOWN: Line protocol on Interface
    changed state to up
*May 18 22:43:08.431: %LINEPROTO-5-UPDOWN: Line protocol on Interface
    changed state to up
R3(config-if) # no shutdown
*May 18 22:43:10.975: %LINK-3-UPDOWN: Interface Serial4/1, changed sta
R3(config-if) # no shutdown
*May 18 22:43:11.983: %LINEPROTO-5-UPDOWN: Line protocol on Interface
    changed state to up
R3(config-if) # no shutdown █

```

b.Verify the configuration by using the show interfaces description command.

R1# show interfaces description | include up

```

^May 18 22:45:00.307: %SYS-5-CONFIG_I: Configured from console
R1#show interfaces description | include up
Se4/0                  up          up      R1 -->
Se4/1                  up          down     R1 -->
Lo0                   up          up      R1 LAN
R1# █

```

Step 2: Configure static routing.

- a. Implement the routing policies on the respective routers.

Router R1

```
R1(config)# ip route 0.0.0.0 0.0.0.0 209.165.201.1  
R1(config)#
```

Router ISP1 (R2)

```
ISP1(config)# router eigrp 1  
ISP1(config-router)# network 209.165.200.224 0.0.0.3  
ISP1(config-router)# network 209.165.201.0 0.0.0.31  
ISP1(config-router)# no auto-summary  
ISP1(config-router)# exit  
ISP1(config)#  
ISP1(config-router)# ip route 192.168.1.0 255.255.255.0 209.165.201.2  
ISP1(config)#
```

Router ISP2 (R3)

```
ISP2(config)# router eigrp 1  
ISP2(config-router)# network 209.165.200.224 0.0.0.3  
ISP2(config-router)# network 209.165.202.128 0.0.0.31  
ISP2(config-router)# no auto-summary  
ISP2(config-router)# exit  
ISP2(config)#  
ISP2(config)# ip route 192.168.1.0 255.255.255.0 209.165.202.130
```

```
R3(config) #ip route 192.168.1.0 255.255.255.0 209.165  
R3(config) #  
*May 18 22:51:53.147: %DUAL-6-NBRINFO: EIGRP-IPv4 1:  
serial4/1) is blocked: not on common subnet (209.165.2  
R3(config) #  
*May 18 22:52:07.427: %DUAL-6-NBRINFO: EIGRP-IPv4 1:  
serial4/1) is blocked: not on common subnet (209.165.2  
R3(config) #
```

- b. The Cisco IOS IP SLA feature enables an administrator to monitor network performance between Cisco devices (switches or routers) or from a Cisco device to a remote IP device.

```
foreach address {  
209.165.200.254  
209.165.201.30  
209.165.202.158  
}  
ping $address source 192.168.1.1  
}
```

- c. Trace the path taken to the web server, ISP1 DNS server, and ISP2 DNS server. You can copy the following Tcl script and paste it into R1.

```
foreach address {  
209.165.200.254  
209.165.201.30  
209.165.202.158  
}  
trace $address source 192.168.1.1  
}
```

```
+>(tcl) #}
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 209.165.200.25
Packet sent with a source address of 192.168.1.1
!!!!!
Success rate is 100 percent (5/5), round-trip mi
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 209.165.201.30
Packet sent with a source address of 192.168.1.1
!!!!!
Success rate is 100 percent (5/5), round-trip mi
Type escape sequence to abort.
```

Step 3: Configure IP SLA probes.

a.Create an ICMP echo probe on R1 to the primary DNS server on ISP1 using the ip sla command.

```
R1(config)# ip sla 11
R1(config-ip-sla)# icmp-echo 209.165.201.30
R1(config-ip-sla-echo)# frequency 10
R1(config-ip-sla-echo)# exit
R1(config)#
R1(config)# ip sla schedule 11 life forever start-time now
R1(config)#

```

b.Verify the IP SLAs configuration of operation 11 using the show ip sla configuration 11 command.

R1# show ip sla configuration 11

```
R1#show ip sla configuration
IP SLAs Infrastructure Engine-III
Entry number: 11
Owner:
Tag:
Operation timeout (milliseconds): 5000
Type of operation to perform: icmp-echo
Target address/Source address: 209.165.201.30/0.0.
Type Of Service parameter: 0x0
Request size (ARR data portion): 28
Verify data: No
```

c. Issue the show ip sla statistics command to display the number of successes, failures, and results of the latest operations.

R1# show ip sla statistics

```
R1#show ip sla statistics
IPSLAs Latest Operation Statistics

IPSLA operation id: 11
    Latest RTT: 28 milliseconds
Latest operation start time: 15:49:09 UTC Sat May 7 2022
Latest operation return code: OK
Number of successes: 49
Number of failures: 0
Operation time to live: Forever
```

d. Although not actually required because IP SLA session 11 alone could provide the desired fault tolerance, create a second probe, 22, to test connectivity to the second DNS server located on router ISP2.

```
R1(config)# ip sla 22
R1(config-ip-sla)# icmp-echo 209.165.202.158
R1(config-ip-sla-echo)# frequency 10
R1(config-ip-sla-echo)# exit
R1(config)#
R1(config)# ip sla schedule 22 life forever start-time now
R1(config)# end
R1#
```

e. Verify the new probe using the show ip sla configuration and show ip sla statistics commands.

```
R1# show ip sla configuration 22
```

```
R1#show ip sla configuration 11
IP SLAs Infrastructure Engine-III
Entry number: 11
Owner:
Tag:
Operation timeout (milliseconds): 5000
Type of operation to perform: icmp-echo
Target address/Source address: 209.165.201.30/0.0.0.0
Type Of Service parameter: 0x0
Request size (ARR data portion): 28
Verify data: No
Vrf Name:
Schedule:
```

```
R1# show ip sla statistics 22
```

```
R1#show ip sla statistics 22
IPSLAs Latest Operation Statistics

IPSLA operation id: 22
    Latest RTT: NoConnection/Busy/Timeout
Latest operation start time: 15:55:06 UTC Sat May 7 2022
Latest operation return code: Timeout
Number of successes: 0
Number of failures: 19
Operation time to live: Forever
```

```
R1#
```

Step 4: Configure tracking options.

a.On R1, remove the current default route and replace it with a floating static route having an administrative distance of 5.

```
R1(config)# no ip route 0.0.0.0 0.0.0.0 209.165.201.1
R1(config)# ip route 0.0.0.0 0.0.0.0 209.165.201.1 5
R1(config)# exit
```

```
R1(config)#ip route 0.0.0.0 0.0.0.0 209.165.201.1 5
R1(config)#exit
R1#
*May 18 23:17:05.843: %SYS-5-CONFIG_I: Configured from c
R1#
```

b.Verify the routing table.

R1# show ip route | begin Gateway

```
R1#conf t
Enter configuration commands, one per line. End with CNTL/Z.
R1(config)#no ip route 0.0.0.0 0.0.0.0 209.165.201.1
R1(config)#ip route 0.0.0.0 0.0.0.0 209.165.201.1 5
R1(config)#exit
R1#
*May 7 15:57:11.527: %SYS-5-CONFIG_I: Configured from console by console
R1#show ip route | begin Gateway
Gateway of last resort is 209.165.201.1 to network 0.0.0.0

S*    0.0.0.0/0 [5/0] via 209.165.201.1
      192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
C      192.168.1.0/24 is directly connected, Loopback0
L      192.168.1.1/32 is directly connected, Loopback0
      209.165.201.0/24 is variably subnetted, 2 subnets, 2 masks
C      209.165.201.0/30 is directly connected, Serial4/0
L      209.165.201.2/32 is directly connected, Serial4/0
      209.165.202.0/24 is variably subnetted, 2 subnets, 2 masks
C      209.165.202.128/30 is directly connected, Serial4/2
L      209.165.202.130/32 is directly connected, Serial4/2
R1#
```

C .From global configuration mode on R1, use the track 1 ip sla 11 reachability command to enter the config-track subconfiguration mode.

R1(config)# track 1 ip sla 11 reachability

R1(config-track)#

d. Specify the level of sensitivity to changes of tracked objects to 10 seconds of down delay and 1 second of up delay using the delay down 10 up 1 command.

R1(config-track)# delay down 10 up 1

R1(config-track)# exit

R1(config)#

e. To view routing table changes as they happen, first enable the debug ip routing command.

R1# debug ip routing

```
R1(config)#exit
R1#debug ip routing
*May 18 23:19:44.487: %SYS-5-CONFIG_
R1#debug ip routing
IP routing debugging is on
R1#
```

f. Configure the floating static route that will be implemented when tracking object 1 is active.

R1(config)# ip route 0.0.0.0 0.0.0.0 209.165.201.1 2 track 1

R1(config)#

```
*May 18 23:23:14.759: RT: updating static 0.0.0.0/0 (0x0):
  via 209.165.201.1 1048578

*May 18 23:23:14.763: RT: closer admin distance for 0.0.0.
*May 18 23:23:14.767: RT: add 0.0.0.0/0 via 209.165.201.1,
*May 18 23:23:14.771: RT: updating static 0.0.0.0/0 (0x0):
  via 209.165.201.1 1048578

*May 18 23:23:14.775: RT: rib update return code: 17
*May 18 23:23:14.775: RT: updating static 0.0.0.0/0 (0x0):
  via 209.165.201.1 1048578

*May 18 23:23:14.775: RT: rib update return code: 17
```

g. Repeat the steps for operation 22, track number 2, and assign the static route an admin distance higher than track 1 and lower than 5.

```
R1(config)# track 2 ip sla 22 reachability
R1(config-track)# delay down 10 up 1
R1(config-track)# exit
R1(config)#
R1(config)# ip route 0.0.0.0 0.0.0.0 209.165.202.129 3 track 2
R1(config)#
h. Verify the routing table again.
```

R1#show ip route | begin Gateway

```
R1#show ip route | begin Gateway
Gateway of last resort is 209.165.201.1 to network 0.0.0.0

S*      0.0.0.0/0 [2/0] via 209.165.201.1
        192.168.1.0/24 is variably subnetted, 2 subnets, 2 ma
C          192.168.1.0/24 is directly connected, Loopback0
L          192.168.1.1/32 is directly connected, Loopback0
        209.165.201.0/24 is variably subnetted, 2 subnets, 2
C          209.165.201.0/30 is directly connected, Serial4/0
L          209.165.201.2/32 is directly connected, Serial4/0
R1#
```

Step 5: Verify ip sla operation.

a. On ISP1, disable the loopback interface 1.

```
ISP1(config-if)# int lo1
```

```
ISP1(config-if)# shutdown
ISP1(config-if)#

```

```
R1(config-if) #shutdown
R1(config-if) #
*May 18 23:27:31.999: %LINEPROTO-5-UPDOWN: Line
  changed state to down
*May 18 23:27:32.003: %LINK-5-CHANGED: Interface
  inistratively down
R1(config-if) #
```

b. On R1, observe the debug output being generated.

R1# show ip route | begin Gateway

```
R1#show ip route | begin Gateway
Gateway of last resort is 209.165.201.1 to network 0.0.0.0

S*   0.0.0.0/0 [5/0] via 209.165.201.1
    192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
C     192.168.1.0/24 is directly connected, Loopback0
L     192.168.1.1/32 is directly connected, Loopback0
    209.165.201.0/24 is variably subnetted, 2 subnets, 2 masks
C     209.165.201.0/30 is directly connected, Serial4/0
L     209.165.201.2/32 is directly connected, Serial4/0
    209.165.202.0/24 is variably subnetted, 2 subnets, 2 masks
C     209.165.202.128/30 is directly connected, Serial4/2
L     209.165.202.130/32 is directly connected, Serial4/2
R1#show ip sla statistics
```

c. Verify the IP SLA statistics.

R1# show ip sla statistics

```
R1#show ip sla statistics
IPSLAs Latest Operation Statistics

IPSLA operation id: 11
    Latest RTT: NoConnection/Busy/Timeout
Latest operation start time: 16:12:49 UTC Sat May 7 2022
Latest operation return code: Timeout
Number of successes: 167
Number of failures: 24
Operation time to live: Forever

IPSLA operation id: 22
    Latest RTT: NoConnection/Busy/Timeout
Latest operation start time: 16:12:46 UTC Sat May 7 2022
Latest operation return code: Timeout
```

d. On R1, initiate a trace to the web server from the internal LAN IP address.

R1# trace 209.165.200.254 source 192.168.1.1

e. On ISP1, re-enable the DNS address by issuing the no shutdown command on the loopback 1 interface

ISP1(config-if)# no shutdown

```
[P routing debugging is on
R1#conf t
Enter configuration commands, one per line. End with CNTL/D
R1(config)#ip route 0.0.0.0 0.0.0.0 209.165.201.1 2 track 1
R1(config)#
May  7 15:59:31.491: RT: updating static 0.0.0.0/0 (0x0):
    via 209.165.201.1    1048578

May  7 15:59:31.491: RT: closer admin distance for 0.0.0.0
>
May  7 15:59:31.491: RT: add 0.0.0.0/0 via 209.165.201.1,
>
May  7 15:59:31.491: RT: updating static 0.0.0.0/0 (0x0):
    via 209.165.201.1    1048578

May  7 15:59:31.491: RT: rib update return code: 17
May  7 15:59:31.491: RT: updating static 0.0.0.0/0 (0x0):
    via 209.165.201.1    1048578
```

f. Again examine the IP SLA statistics.

R1# show ip sla statistics

```
R1#show ip sla configuration 22
IP SLAs Infrastructure Engine-III
Entry number: 22
Owner:
Tag:
Operation timeout (milliseconds): 5000
Type of operation to perform: icmp-echo
Target address/Source address: 209.165.202.158/
Type Of Service parameter: 0x0
Request size (ARR data portion): 28
Verify data: No
Irf Name: .
```

g. Verify the routing table.

R1# show ip route | begin Gateway

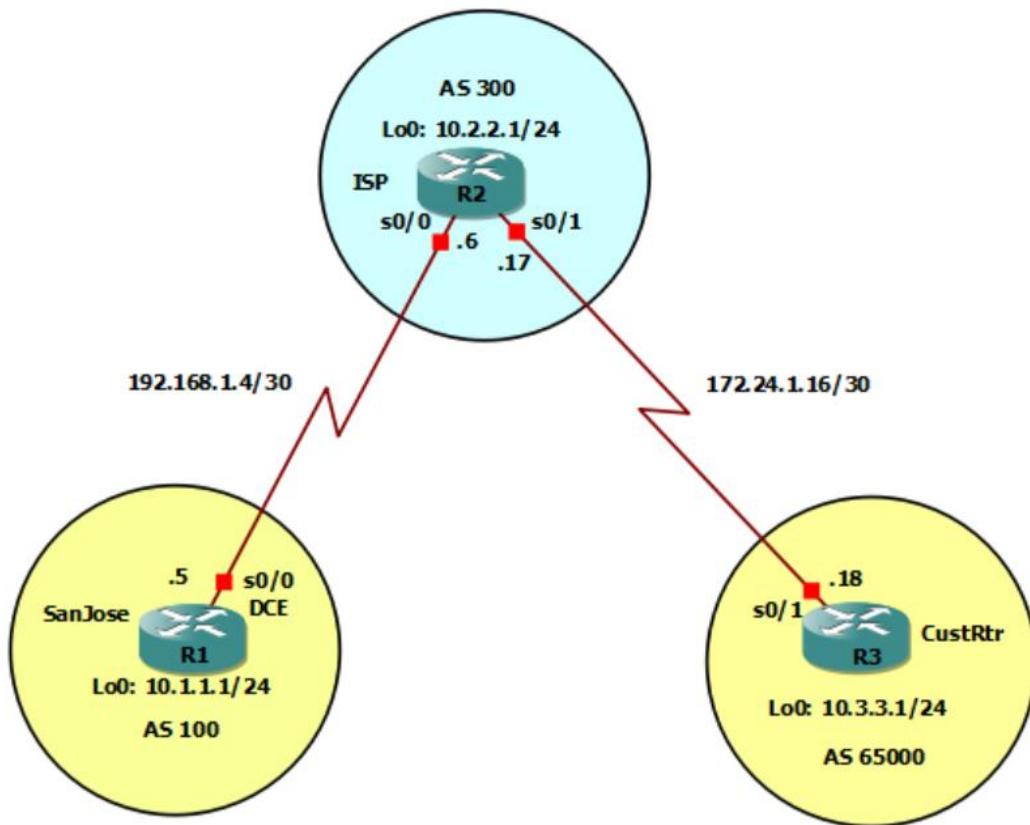

```
R1#conf t
Enter configuration commands, one per line. End with CNTL/Z.
R1(config)#no ip route 0.0.0.0 0.0.0.0 209.165.201.1
R1(config)#ip route 0.0.0.0 0.0.0.0 209.165.201.1 5
R1(config)#exit
R1#
*May 7 15:57:11.527: %SYS-5-CONFIG_I: Configured from console by console
R1#show ip route | begin Gateway
Gateway of last resort is 209.165.201.1 to network 0.0.0.0

S*    0.0.0.0/0 [5/0] via 209.165.201.1
      192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
C      192.168.1.0/24 is directly connected, Loopback0
L      192.168.1.1/32 is directly connected, Loopback0
      209.165.201.0/24 is variably subnetted, 2 subnets, 2 masks
C      209.165.201.0/30 is directly connected, Serial4/0
L      209.165.201.2/32 is directly connected, Serial4/0
      209.165.202.0/24 is variably subnetted, 2 subnets, 2 masks
C      209.165.202.128/30 is directly connected, Serial4/2
L      209.165.202.130/32 is directly connected, Serial4/2
R1#
```

Practical No – 2

Aim: Using the AS_PATH Attribute.

Topology :

Objectives:

- Use BGP commands to prevent private AS numbers from being advertised to the outside world.
- Use the AS_PATH attribute to filter BGP routes based on their source AS numbers.

Required Resources

- 3 routers (Cisco IOS Release 15.2 or comparable)
- Serial and Ethernet cables

Step 0: Prepare the routers for the lab.

a. Apply the following configuration to each router along with the appropriate hostname. The exec-timeout 0 0 command should only be used in a lab environment

```
Router(config)# no ip domain-lookup
Router(config)# line con 0
Router(config-line)# logging synchronous
Router(config-line)# exec-timeout 0 0
```

Step 2 : Configure the hostname and interface addresses.

a. You can copy and paste the following configurations into your routers to begin.

```
SanJose(config)# interface Loopback0
SanJose(config-if)# ip address 10.1.1.1 255.255.255.0
SanJose(config-if)# exit
```

```
SanJose(config)# interface Serial0/0/0
SanJose(config-if)# ip address 192.168.1.5 255.255.255.252
SanJose(config-if)# clock rate 128000
SanJose(config-if)# no shutdown
SanJose(config-if)# end
```

SanJose#

```
R1#

changed state to up
*Mar 1 00:18:00.959: %SYS-5-CONFIG_I: Configured from console by consol
R3#

```

b. Use ping to test the connectivity between the directly connected routers.

```

R2#ping 192.168.1.5
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 192.168.1.5, timeout is 2 sec
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/8/
R2#

```

Step 3 : Configure BGP.

- a. Configure BGP for normal operation. Enter the appropriate BGP commands on each router so that they identify their BGP neighbors and advertise their loopback networks.**

SanJose#show ip route

```

R1#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
      E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
      ia - IS-IS inter area, * - candidate default, U - per-user static
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

C       10.0.0.0/24 is subnetted, 1 subnets
C           10.1.1.0 is directly connected, Loopback0
C           192.168.1.0/30 is subnetted, 1 subnets
C               192.168.1.4 is directly connected, Serial0/0
R1#

```

b. Ping the 10.3.3.1 address from SanJose.

```

R1#ping 10.3.3.1

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.3.3.1, timeout is 2 seconds:
.....
Success rate is 0 percent (0/5)
R1#

```

c. Ping again, this time as an extended ping, sourcing from the Loopback0 interface address.

```

R1#ping
Protocol [ip]:
Target IP address: 10.3.3.1
Repeat count [5]:
Datagram size [100]:
Timeout in seconds [2]:
Extended commands [n]: y
Source address or interface: 10.1.1.1
Type of service [0]:
Set DF bit in IP header? [no]:
Validate reply data? [no]:
Data pattern [0xABCD]:
Loose, Strict, Record, Timestamp, Verbose[none]:
Sweep range of sizes [n]:
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.3.3.1, timeout is 2 seconds:
Packet sent with a source address of 10.1.1.1
.....
Success rate is 0 percent (0/5)

```

SanJose# ping 10.3.3.1 source 10.1.1.1

```

R1#ping 10.3.3.1 source 10.1.1.1
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.3.3.1, timeout is 2 seconds:
Packet sent with a source address of 10.1.1.1
.....
Success rate is 0 percent (0/5)
R1#

```

d. Check the BGP table from SanJose by using the show ip bgp command.

```
SanJose# show ip bgp
```

```
R1#show ip bgp
BGP table version is 3, local router ID is 10.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop            Metric LocPrf Weight Path
*-> 10.1.1.0/24      0.0.0.0                  0        32768  i
*-> 10.3.3.0/24    192.168.1.6                 0     300 65000  i
R1#
```

e. Configure ISP to strip the private AS numbers from BGP routes exchanged with SanJose using the following commands.

```
ISP(config)# router bgp 300
```

```
ISP(config-router)# neighbor 192.168.1.5 remove-private-as
```

```
Enter configuration commands, one per line. End with CNTL/Z.
R2(config)#router bgp 300
R2(config-router)#neighbor 192.168.1.5 remove-private-as
% Specify remote-as or peer-group commands first
R2(config-router) #
```

f. After issuing these commands, use the clear ip bgp * command on ISP to reestablish the BGP relationship between the three routers.

```
ISP# clear ip bgp *
```

```
R2#clear ip bgp *
R2#
*Mar  1 00:58:11.299: %BGP-5-ADJCHANGE: neighbor 172.24.1.18 Down User reset
*Mar  1 00:58:11.299: %BGP-5-ADJCHANGE: neighbor 192.168.1.5 Down User reset
*Mar  1 00:58:11.883: %BGP-5-ADJCHANGE: neighbor 172.24.1.18 Up
R2#
*Mar  1 00:58:12.407: %BGP-5-ADJCHANGE: neighbor 192.168.1.5 Up
R2#
```

```
SanJose# show ip route
```

```
R1#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static
       o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      10.0.0.0/24 is subnetted, 1 subnets
C        10.1.1.0 is directly connected, Loopback0
      192.168.1.0/30 is subnetted, 1 subnets
C        192.168.1.4 is directly connected, Serial0/0
```

```
SanJose# ping 10.3.3.1 source lo0
```

```
R1#ping 10.3.3.1 source lo0
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.3.3.1, timeout is 2 seconds:
Packet sent with a source address of 10.1.1.1
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/10/32 ms
```

- g. Now check the BGP table on SanJose. The AS_PATH to the 10.3.3.0 network should be AS 300. It no longer has the private AS in the path.

```
SanJose# show ip bgp
```

```
R1#show ip bgp
BGP table version is 6, local router ID is 10.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop            Metric LocPrf Weight Path
*-> 10.1.1.0/24      0.0.0.0                  0        32768  i
*-> 10.3.3.0/24      192.168.1.6              0        0      3
R1#
```

Step 4 : Remove the private AS.

- a. Configure a special kind of access list to match BGP routes with an AS_PATH attribute that both begins and ends with the number 100.

```
ISP(config)# ip as-path access-list 1 deny ^100$
```

```
ISP(config)# ip as-path access-list 1 permit *
```

```
ISP(config)# router bgp 300
```

```
ISP(config-router)# neighbor 172.24.1.18 filter-list 1 out
```

- b. Use the clear ip bgp * command to reset the routing information.

```
ISP# clear ip bgp *
```

```
R2#clear ip bgp *
R2#
*Mar  1 01:20:12.331: %BGP-5-ADJCHANGE: neighbor 172.24.1.18 I
*Mar  1 01:20:12.331: %BGP-5-ADJCHANGE: neighbor 192.168.1.5 I
R2#
*Mar  1 01:20:13.439: %BGP-5-ADJCHANGE: neighbor 192.168.1.5 U
R2#
*Mar  1 01:20:14.875: %BGP-5-ADJCHANGE: neighbor 172.24.1.18 U
```

```
ISP# show ip route
```

```

R2#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
      E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
      ia - IS-IS inter area, * - candidate default, U - per-user static
      e
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      172.24.0.0/30 is subnetted, 1 subnets
C          172.24.1.16 is directly connected, Serial0/1
          10.0.0.0/24 is subnetted, 3 subnets
B          10.3.3.0 [20/0] via 172.24.1.18, 00:00:28

```

c. Check the routing table for CustRtr. It should not have a route to 10.1.1.0 in its routing table.

CustRtr# show ip route

```

R3#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
      E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
      ia - IS-IS inter area, * - candidate default, U - per-user static rout
      e
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      172.24.0.0/30 is subnetted, 1 subnets
C          172.24.1.16 is directly connected, Serial0/1
          10.0.0.0/24 is subnetted, 1 subnets
C          10.3.3.0 is directly connected, Loopback0
R3#

```

e. Return to ISP and verify that the filter is working as intended. Issue the show ip bgp regexp ^100\$ command.

ISP# show ip bgp regexp ^100\$

```

R2#Show ip bgp regexp ^100$
BGP table version is 3, local router ID is 10.2.2.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - interna
l,
r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop            Metric LocPrf Weight Path

Success rate is 100 percent (5/5), round-trip min/avg/max = 1/4/16 ms
n>#

```

Practical No – 3

Aim: Configuring IBGP and EBGP Sessions, Local Preference, and MED

Topolgy :

Objectives:

- For IBGP peers to correctly exchange routing information, use the **next-hop-self** command with the **Local-Preference** and **MED** attributes.
- Ensure that the flat-rate, unlimited-use T1 link is used for sending and receiving data to and from the AS 200 on ISP and that the metered T1 only be used in the event that the primary T1 link has failed.

Required Resources

- 3 routers (Cisco IOS Release 15.2 or comparable)
- Serial and Ethernet cables

Step 0: Suggested starting configurations.

- Apply the following configuration to each router along with the appropriate hostname.
Router(config)# no ip domain-lookup

```
Router(config)# line con 0
```

```
Router(config-line)# logging synchronous
```

```
Router(config-line)# exec-timeout 0 0
```

Step 1: Configure interface addresses.

- Using the addressing scheme in the diagram, create the loopback interfaces and apply IPv4 addresses to these and the serial interfaces on ISP (R1), SanJose1 (R2), and SanJose2 (R3)

Router R1 (hostname ISP)

```
ISP(config)# interface Loopback0
ISP(config-if)# ip address 192.168.100.1 255.255.255.0
ISP(config-if)# exit
ISP(config)# interface Serial0/0/0
```

```

ISP(config-if)# ip address 192.168.1.5 255.255.255.252
ISP(config-if)# clock rate 128000
ISP(config-if)# no shutdown
ISP(config-if)# exit
ISP(config)# interface Serial0/0/1
ISP(config-if)# ip address 192.168.1.1 255.255.255.252
ISP(config-if)# no shutdown
ISP(config-if)# end
ISP#

```

```

*Mar 1 00:03:44.479: %LINEPROTO-5-UPDOWN: Line protocol on Interface Loopback0, changed state
*Mar 1 00:03:45.087: %SYS-5-CONFIG_I: Configured from console by console

ISP#
```

Step 2: Configure EIGRP.

Configure EIGRP between the SanJose1 and SanJose2 routers.

```
SanJose1(config)# router eigrp 1
```

```
SanJose1(config-router)# network 172.16.0.0
```

```
SanJose1#conf t
Enter configuration commands, one per line. End with CNTL/Z.
SanJose1(config)#router eigrp 1
SanJose1(config-router)#network 172.16.0.0
SanJose1(config-router)#
*Mar 1 00:17:55.395: %DUAL-5-NBRCHANGE: IP-EIGRP(0) 1: Neighbor 172.16.1.2 (Serial0/1) is up: ne
SanJose1(config-router)#
SanJose1#
```

```
SanJose2(config)# router eigrp 1
```

```
SanJose2(config-router)# network 172.16.0.0
```

```

SanJose2#conf t
Enter configuration commands, one per line. End with CNTL/Z.
SanJose2(config)#router eigrp 1
SanJose2(config-router)#network 172.16.0.0
SanJose2(config-router)#
*Mar 1 00:17:51.063: %DUAL-5-NBRCHANGE: IP-EIGRP(0) 1: Neighbor 172.16.1.1 (Serial0/1) is up:
SanJose2(config-router)#

```

Step 3: Configure IBGP and verify BGP neighbors.

- a. Configure IBGP between the SanJose1 and SanJose2 routers. On the SanJose1 router, enter the following configuration.

```

SanJose1(config)# router bgp 64512
SanJose1(config-router)# neighbor 172.16.32.1 remote-as 64512
SanJose1(config-router)# neighbor 172.16.32.1 update-source lo0
R2#show ip bgp neighbors
BGP neighbor is 172.16.32.1, remote AS 64512, internal link
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Active
  Last read 00:06:57, last write 00:06:57, hold time is 180, keep
  al is 60 seconds
  Message statistics:
    InQ depth is 0
    OutQ depth is 0
          Sent        Rcvd
  Opens:          0          0
  Notifications: 0          0
  Updates:       0          0
  Keepalives:    0          0
  Route Refresh: 0          0

```

- b. Complete the IBGP configuration on SanJose2 using the following commands.

```

SanJose2(config)# router bgp 64512
SanJose2(config-router)# neighbor 172.16.64.1 remote-as 64512
SanJose2(config-router)# neighbor 172.16.64.1 update-source lo0
R3#show ip bgp summary
*Mar 1 00:43:06.295: %SYS-5-CONFIG_I: Configured from console by c
R3#show ip bgp summary
BGP router identifier 172.16.32.1, local AS number 64512
BGP table version is 2, main routing table version 2
1 network entries using 120 bytes of memory
1 path entries using 52 bytes of memory
2/1 BGP path/bestpath attribute entries using 248 bytes of memory
0 BGP route-map cache entries using 0 bytes of memory
0 BGP filter-list cache entries using 0 bytes of memory
BGP using 420 total bytes of memory
BGP activity 1/0 prefixes, 1/0 paths, scan interval 60 secs

```

- c. Verify that SanJose1 and SanJose2 become BGP neighbors by issuing the show ip bgp neighbors command on SanJose1.

```

SanJose2# show ip bgp neighbors
BGP neighbor is 172.16.64.1, remote AS 64512, internal link
  BGP version 4, remote router ID 172.16.64.1
  BGP state = Established, up for 00:00:22
  Last read 00:00:22, last write 00:00:22, hold time is 180, keepalive interval is 60 seconds
<output omitted>

```

```

R3#show ip bgp neighbors
*Mar 1 00:35:02.307: %SYS-5-CONFIG_I: Configured from console by console
R3#show ip bgp neighbors
BGP neighbor is 172.16.64.1, remote AS 64512, internal link
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Active
  Last read 00:00:35, last write 00:00:35, hold time is 180, keepalive interval is 60 seconds
  Message statistics:
    InQ depth is 0
    OutQ depth is 0
          Sent      Rcvd
  Opens:          0          0
  Notifications: 0          0
  Updates:        0          0
  Keepalives:     0          0

```

Step 4: Configure EBGP and verify BGP neighbors.

a. Configure ISP to run EBGP with SanJose1 and SanJose2. Enter the following commands on ISP.

```

ISP(config)# router bgp 200
ISP(config-router)# neighbor 192.168.1.6 remote-as 64512
ISP(config-router)# neighbor 192.168.1.2 remote-as 64512
ISP(config-router)# network 192.168.100.0

```

```

ISP(config)#router bgp 200
ISP(config-router)#neighbor 192.168.1.6 remote-as 64512
ISP(config-router)#neighbor 192.168.1.2 remote-as 64512
ISP(config-router)#network 192.168.100.0

```

```

SanJose1(config)# ip route 172.16.0.0 255.255.0.0 null0

```

c. Configure SanJose1 as an EBGP peer to ISP

```

SanJose1(config)# router bgp 64512
SanJose1(config-router)# neighbor 192.168.1.5 remote-as 200
SanJose1(config-router)# network 172.16.0.0

```

```

R2#show ip bgp neighbors
BGP neighbor is 172.16.32.1, remote AS 64512, internal link
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Active
  Last read 00:06:57, last write 00:06:57, hold time is 180,
  al is 60 seconds
  Message statistics:
    InQ depth is 0
    OutQ depth is 0
      Sent          Rcvd
    Opens:          0          0
  Notifications:  0          0
  Updates:        0          0
  Keepalives:     0          0
  Route Refresh: 0          0
  Total:          0          0
Default minimum time between advertisement runs is 0 second

For address family: IPv4 Unicast
  BGP table version 2, neighbor version 0/0
  Output queue size: 0
  Index 1, Offset 0, Mask 0x2
  1 update-group member
      Sent          Rcvd
  Prefix activity:  ----  -----

```

d. Use the show ip bgp neighbors command to verify that SanJose1 and ISP have reached the established state.

```

SanJose1# show ip bgp neighbors
BGP neighbor is 172.16.32.1, remote AS 64512, internal link
  BGP version 4, remote router ID 172.16.32.1
  BGP state = Established, up for 00:12:43
<output omitted>

```

```

BGP neighbor is 192.168.1.5, remote AS 200, external link
  BGP version 4, remote router ID 192.168.100.1
  BGP state = Established, up for 00:06:49
  Last read 00:00:42, last write 00:00:45, hold time is 180, keepalive interval is 60 seconds
<output omitted>

```

```

R2#show ip bgp neighbors
BGP neighbor is 172.16.32.1, remote AS 64512, internal link
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Active
  Last read 00:06:57, last write 00:06:57, hold time is 180, keepalive interval is 60 seconds
  Message statistics:
    InQ depth is 0

```

e. Configure a discard static route for 172.16.0.0/16 on SanJose2 and as an EBGP peer to ISP.

```

SanJose2(config)# ip route 172.16.0.0 255.255.0.0 null0
SanJose2(config)# router bgp 64512
SanJose2(config-router)# neighbor 192.168.1.1 remote-as 200
SanJose2(config-router)# network 172.16.0.0

```

```

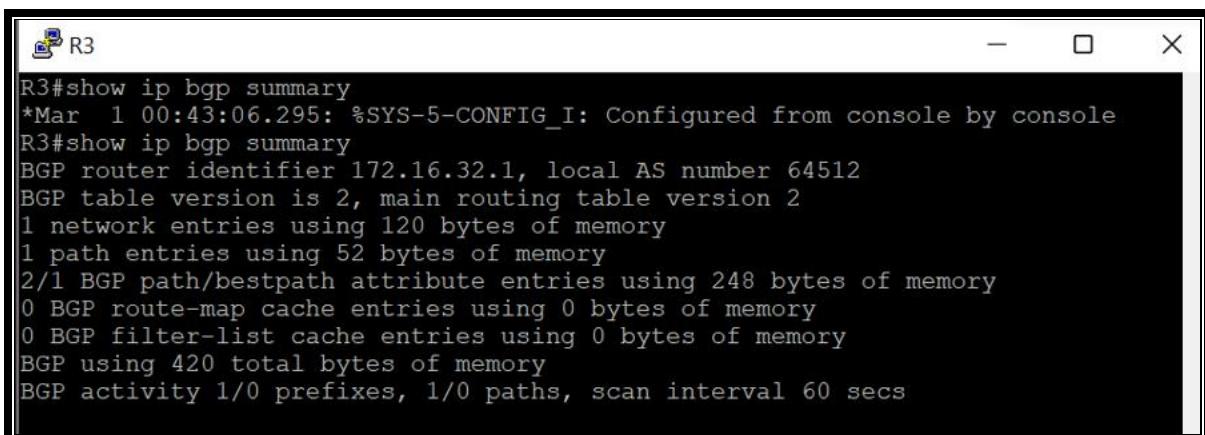

R3(config-router)#neighbor 192.168.1.1 route-map SECONDARY_T1_IN in
R3(config-router)#exit
R3(config)#exit
R3#
*Mar 1 01:14:18.127: %SYS-5-CONFIG_I: Configured from console by console
R3#clear ip bgp * soft
R3#show ip bgp
BGP table version is 2, local router ID is 172.16.32.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - incomplete
l,
r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop            Metric LocPrf Weight Path
*-> 172.16.0.0        0.0.0.0              0          32768 i
R3#

```

Step 5: View BGP summary output.

SanJose2# show ip bgp summary

```

R3#show ip bgp summary
*Mar 1 00:43:06.295: %SYS-5-CONFIG_I: Configured from console by console
R3#show ip bgp summary
BGP router identifier 172.16.32.1, local AS number 64512
BGP table version is 2, main routing table version 2
1 network entries using 120 bytes of memory
1 path entries using 52 bytes of memory
2/1 BGP path/bestpath attribute entries using 248 bytes of memory
0 BGP route-map cache entries using 0 bytes of memory
0 BGP filter-list cache entries using 0 bytes of memory
BGP using 420 total bytes of memory
BGP activity 1/0 prefixes, 1/0 paths, scan interval 60 secs

```

Step 6: Verify which path the traffic takes.

- f. Clear the IP BGP conversation with the **clear ip bgp *** command on ISP. Wait for the conversations to reestablish with each SanJose router.

ISP# clear ip bgp *

```

R2(config)#exit
R2#clear ip bgp * soft
*Mar 1 01:14:25.319: %SYS-5-CONFIG_I: Configured from console by console
R2#clear ip bgp * soft
R2#show ip bgp
BGP table version is 4, local router ID is 172.16.64.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

R2#

```

g. Test whether ISP can ping the loopback 0 address of 172.16.64.1 on SanJose1 and the serial link between SanJose1 and SanJose2, 172.16.1.1.

ISP# ping 172.16.64.1

```

R1#ping 172.16.32.1

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.32.1, timeout is 2 seconds:
UUUUU
Success rate is 0 percent (0/5)
R1#ping 172.16.1.2

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.1.2, timeout is 2 seconds.

```

h. Now ping from ISP to the loopback 0 address of 172.16.32.1 on SanJose2 and the serial link between SanJose1 and SanJose2, 172.16.1.2.

ISP# ping 172.16.32.1

```

R1#ping 172.16.32.1

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.32.1,
UUUUU
Success rate is 0 percent (0/5)
R1#ping 172.16.1.2

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.1.2,
.....
Success rate is 0 percent (0/5)

```

i. Issue the show ip bgp command on ISP to verify BGP routes and metrics.

ISP# show ip bgp

```
R1#show ip bgp
BGP table version is 4, local router ID is 192.168.100.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale

R1#
```

Step 7: Configure the BGP next-hop-self feature.

- a. Issue the following commands on the ISP router.

```
ISP(config)# router bgp 200
ISP(config-router)# network 192.168.1.0 mask 255.255.255.252
ISP(config-router)# network 192.168.1.4 mask 255.255.255.252
```

- b. Issue the show ip bgp command to verify that the ISP is correctly injecting its own WAN links into BGP.

```
ISP#show ip bgp
BGP table version is 5, local router ID is 192.168.100.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop            Metric LocPrf Weight Path
*  172.16.0.0        192.168.1.6          0        0 64512 i

*> 192.168.1.0/30    0.0.0.0            0        32768 i
*> 192.168.1.4/30    0.0.0.0            0        32768 i
*> 192.168.100.0     0.0.0.0            0        32768 i
ISP#
```

- c. Verify on SanJose1 and SanJose2 that the opposite WAN link is included in the routing table. The output from SanJose2 is as follows.

```
SanJose2# show ip route
```

```
192.168.0.0      0.0.0.0      0           0/00  I
R3#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static rout
e
       o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      172.16.0.0/16 is variably subnetted, 3 subnets, 2 masks
C         172.16.32.0/24 is directly connected, Loopback0
```

- d. To better understand the next-hop-self command we will remove ISP advertising its two WAN links and shutdown the WAN link between ISP and SanJose2.

```
ISP(config)# router bgp 200
ISP(config-router)# no network 192.168.1.0 mask 255.255.255.252
ISP(config-router)# no network 192.168.1.4 mask 255.255.255.252
ISP(config-router)# exit
ISP(config)# interface serial 0/0/1
ISP(config-if)# shutdown
ISP(config-if)#
```

```
R1#show ip bgp

Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop          Metric LocPrf Weight
```

- e. Display SanJose2's BGP table using the show ip bgp command and the IPv4 routing table with show ip route.

SanJose2# show ip bgp

```
R3#show ip bgp
BGP table version is 1, local router ID is 172.16.32.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - in
l,
r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

Network          Next Hop          Metric LocPrf Weight Path
* 172.16.0.0      0.0.0.0          0        32768 i
```

SanJose2# show ip route

```
R3#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
      E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-
      ia - IS-IS inter area, * - candidate default, U - per-user static ro
      e
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set
```

- f. Issue the next-hop-self command on SanJose1 and SanJose2 to advertise themselves as the next hop to their IBGP peer.

SanJose1(config)# router bgp 64512
SanJose1(config-router)# neighbor 172.16.32.1 next-hop-self

SanJose2(config)# router bgp 64512
SanJose2(config-router)# neighbor 172.16.64.1 next-hop-self

- g. Reset BGP operation on either router with the clear ip bgp * command

SanJose1# clear ip bgp *
SanJose1#

SanJose2# clear ip bgp *
SanJose2#

```

R3#clear ip bgp *
*Mar 1 01:05:40.527: %SYS-5-CONFIG_I: Configured from console by
R3#clear ip bgp *
R3#show ip bgp
BGP table version is 1, local router ID is 172.16.32.1
Status codes: s suppressed, d damped, h history, * valid, > best,
l,
r RIB-failure, S Stale

```

- h.** After the routers have returned to established BGP speakers, issue the show ip bgp command on SanJose2 and notice that the next hop is now SanJose1 instead of ISP

SanJose2# show ip bgp

```

R3#show ip bgp
BGP table version is 1, local router ID is 172.16.32.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - inter-
l,
r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop            Metric LocPrf Weight Path
* 172.16.0.0        0.0.0.0              0        32768  i

```

- i.** The show ip route command on SanJose2 now displays the 192.168.100.0/24 network because SanJose1 is the next hop, 172.16.64.1, which is reachable from SanJose2.

SanJose2# show ip route

```

R3#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
      E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-
      ia - IS-IS inter area, * - candidate default, U - per-user static ro-
e
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

```

- j.** Before configuring the next BGP attribute, restore the WAN link between ISP and SanJose3.

```

ISP(config)# interface serial 0/0/1
ISP(config-if)# no shutdown
ISP(config-if)#

```

SanJose2# show ip route

```

R3#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area

Gateway of last resort is not set

  172.16.0.0/16 is variably subnetted, 3 subnets, 2 masks
    172.16.0.0/16 is variably subnetted, 2 subnets, 2 masks

```

Step 8: Set BGP local preference.

- a. Use the clear ip bgp * soft command after configuring this new policy.

SanJose1# clear ip bgp * soft

```

R2(config)#exit
R2#clear ip bgp * soft
*Mar  1 01:14:25.319: %SYS-5-CONFIG_I: Configured from console by console
R2#clear ip bgp * soft
R2#show ip bgp
BGP table version is 4, local router ID is 172.16.64.1

R1#

```

Step 10: Establish a default route.

a. Configure ISP to inject a default route to both SanJose1 and SanJose2 using BGP using the default-originate command

```

ISP(config)# router bgp 200
ISP(config-router)# neighbor 192.168.1.6 default-originate
ISP(config-router)# neighbor 192.168.1.2 default-originate

```

```
ISP(config-router)# exit
ISP(config)# interface loopback 10
ISP(config-if)# ip address 10.0.0.1 255.255.255.0
ISP(config-if)#
```

b. Verify that both routers have received the default route by examining the routing tables on SanJose1 and SanJose2.

```
SanJose1# show ip route
SanJose2# show ip bgp
```

```
RJ#show ip bgp summary
BGP router identifier 172.16.32.1, local AS number 1
BGP table version is 2, main routing table version 1
1 network entries using 120 bytes of memory

Practical No – 4

Aim: Secure the Management Plane

Topolgy :

Objectives

- Secure management access.
- Configure enhanced username password security.
- Enable AAA RADIUS authentication.
- Enable secure remote management.

Required Resources

- 3 routers (Cisco IOS Release 15.2 or comparable)
- Serial and Ethernet cables
-

Step 1: Configure loopbacks and assign addresses.

a. Cable the network as shown in the topology diagram. Erase the startup configuration and reload each router to clear previous configurations. Using the addressing scheme in the diagram, apply the IP addresses to the interfaces on the R1, R2, and R3 routers. You can copy and paste the following configurations into your routers to begin.

R1

hostname R1

```
interface Loopback 0
description R1 LAN
ip address 192.168.1.1 255.255.255.0
exit
!
interface Serial0/0
description R1 --> R2
ip address 10.1.1.1 255.255.255.252
clock rate 128000
no shutdown
```

```
exit
```

```
!
```

```
End
```

```
R1(config)#interface Serial0/0
R1(config-if) # description R1 --> R2
R1(config-if) # ip address 10.1.1.1 255.255.255.252
R1(config-if) # clock rate 128000
R1(config-if) # no shutdown
R1(config-if) #exit
R1(config)#!
R1(config)#end
R1#
*Mar 1 00:07:32.339: %LINEPROTO-5-UPDOWN: Line protocol on Interface
    changed state to up
*Mar 1 00:07:33.067: %SYS-5-CONFIG_I: Configured from console by cons
R1#
*Mar 1 00:07:34.747: %LINK-3-UPDOWN: Interface Serial0/0, changed sta
R1#
*Mar 1 00:07:35.751: %LINEPROTO-5-UPDOWN: Line protocol on Interface
    changed state to up
R1#
```

R2

```
hostname R2
```

```
!
```

```
interface Serial0/0
```

```
description R2 --> R1
```

```
ip address 10.1.1.2 255.255.255.252
```

```
no shutdown
```

```
exit
```

```
interface Serial0/1
```

```
description R2 --> R3
```

```
ip address 10.2.2.1 255.255.255.252
```

```
clock rate 128000
```

```
no shutdown
```

```
exit
```

```
!
```

```
End
```

```

R2
R2(config-if) # description R2 --> R1
R2(config-if) # ip address 10.1.1.2 255.255.255.252
R2(config-if) # no shutdown
R2(config-if) #exit
R2(config) #
R2(config)#interface Serial0/1
R2(config-if) # description R2 --> R3
R2(config-if) # ip address 10.2.2.1 255.255.255.252
R2(config-if) # clock rate 128000
R2(config-if) # no shutdown
R2(config-if) #exit
R2(config)#!#
R2(config)#end

changed state to up
*Mar 1 00:08:26.003: %LINEPROTO-5-UPDOWN: Line protocol on Interfa
changed state to up
R2#
```

R3

```

hostname R3
!
interface Loopback0
description R3 LAN
ip address 192.168.3.1 255.255.255.0
exit
```

```

interface Serial0/1
description R3 --> R2
ip address 10.2.2.2 255.255.255.252
no shutdown
exit
!
End
```

```

R3(config-if) # ip address 192.168.3.1 255.255.255.0
R3(config-if) #exit
R3(config) #
R3(config) #
R3(config)#interface Serial0/1
R3(config-if) # description R3 --> R2
R3(config-if) # ip address 10.2.2.2 255.255.255.252
R3(config-if) # no shutdown
R3(config-if) #exit
R3(config)#!#
R3(config)#end
R3#
*Mar 1 00:09:16.191: %SYS-5-CONFIG_I: Configured from console by console
*Mar 1 00:09:17.007: %LINEPROTO-5-UPDOWN: Line protocol on Interface Loopback0,
changed state to up
R3#
*Mar 1 00:09:18.159: %LINK-3-UPDOWN: Interface Serial0/1, changed state to up
R3#
*Mar 1 00:09:19.163: %LINEPROTO-5-UPDOWN: Line protocol on Interface Serial0/1,
changed state to up
R3#
```

Step 2: Configure static routes.

- a. **On R1, configure a default static route to ISP.**

```
R1(config)# ip route 0.0.0.0 0.0.0.0 10.1.1.2
```

- b. **On R3, configure a default static route to ISP.**

```
R3(config)# ip route 0.0.0.0 0.0.0.0 10.2.2.1
```

- c. **On R2, configure two static routes.**

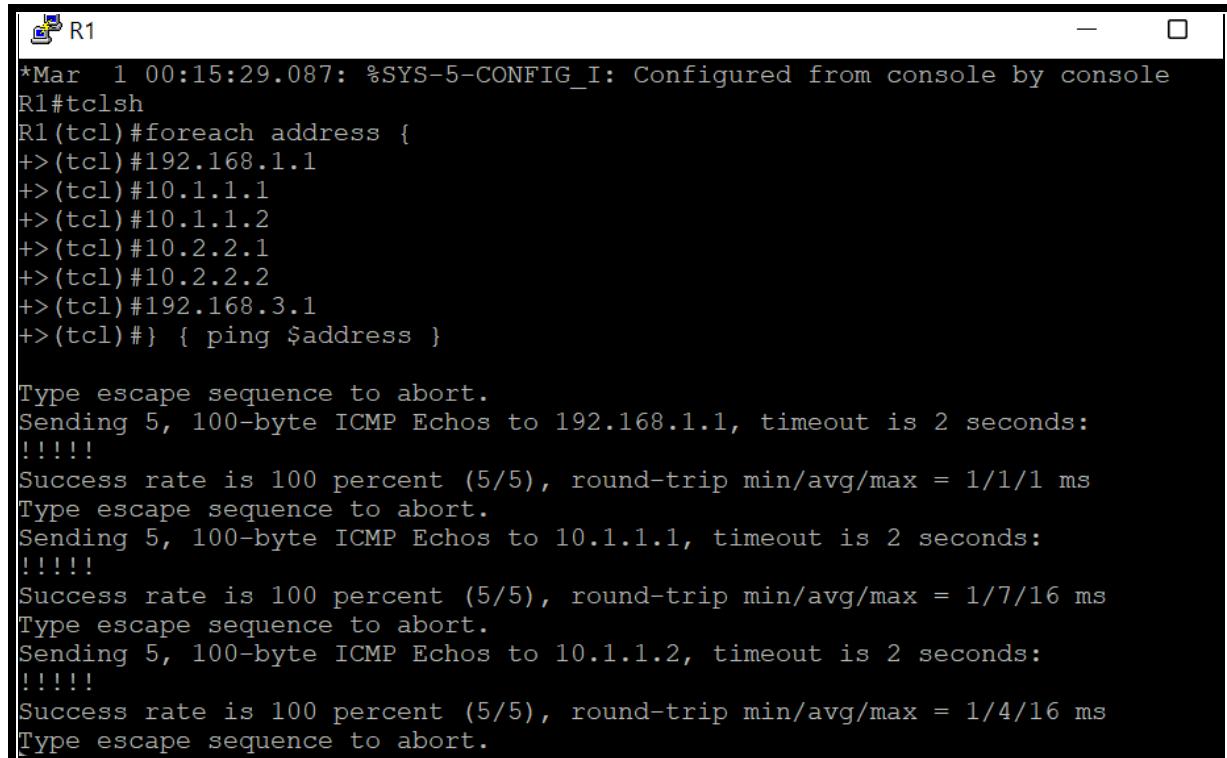

```
R2(config)# ip route 192.168.1.0 255.255.255.0 10.1.1.1
```

```
R2(config)# ip route 192.168.3.0 255.255.255.0 10.2.2.2
```

- d. **From the R1 router, run the following Tcl script to verify connectivity.**

```
R1# tclsh
```

```
foreach address {  
192.168.1.1  
10.1.1.1  
10.1.1.2  
10.2.2.1  
10.2.2.2  
192.168.3.1  
} { ping $address }
```

```
*Mar 1 00:15:29.087: %SYS-5-CONFIG_I: Configured from console by console  
R1#tclsh  
R1(tcl)#foreach address {  
+>(tcl)#192.168.1.1  
+>(tcl)#10.1.1.1  
+>(tcl)#10.1.1.2  
+>(tcl)#10.2.2.1  
+>(tcl)#10.2.2.2  
+>(tcl)#192.168.3.1  
+>(tcl)#{ ping $address }  
  
Type escape sequence to abort.  
Sending 5, 100-byte ICMP Echos to 192.168.1.1, timeout is 2 seconds:  
!!!!!  
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms  
Type escape sequence to abort.  
Sending 5, 100-byte ICMP Echos to 10.1.1.1, timeout is 2 seconds:  
!!!!  
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/7/16 ms  
Type escape sequence to abort.  
Sending 5, 100-byte ICMP Echos to 10.1.1.2, timeout is 2 seconds:  
!!!!  
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/4/16 ms  
Type escape sequence to abort.
```

Step 3: Secure management access.

- a. On R1, use the security passwords command to set a minimum password length of 10 characters.

```
R1(config)# security passwords min-length 10
```

- b. Configure the enable secret encrypted password on both routers.

```
R1(config)# enable secret class12345
```

- c. Configure a console password and enable login for routers. For additional security, the exec-timeout command causes the line to log out after 5 minutes of inactivity.

```
R1(config)# line console 0
R1(config-line)# password ciscoconpass
R1(config-line)# exec-timeout 5 0
R1(config-line)# login
R1(config-line)# logging synchronous
R1(config-line)# exit
R1(config)#
```

- d. Configure the password on the vty lines for router R1.

```
R1(config)# line vty 0 4
R1(config-line)# password ciscovtypass
R1(config-line)# exec-timeout 5 0
R1(config-line)# login
R1(config-line)# exit
R1(config)#
```

- e. The aux port is a legacy port used to manage a router remotely using a modem and is hardly ever used. Therefore, disable the aux port.

```
R1(config)# line aux 0
R1(config-line)# no exec
R1(config-line)# end
R1#
R1(config-line)#exec-timeout 5 0
R1(config-line)#login
R1(config-line)#exit
R1(config)#line aux 0
R1(config-line)#no exec
R1(config-line)#end
R1#
*Mar  1 00:25:37.511: %SYS-5-CONFIG_I: Configured from console by
R1#
```

- f. Enter privileged EXEC mode and issue the show run command. Can you read the enable secret password? Why or why not?

```
R1#showrun
Translating "showrun"
Translating "showrun"
% Unknown command or computer name, or unable to find computer address
R1#show run

```

- k. Exit privileged EXEC mode using the disable or exit command and press Enter to get started.
l. Repeat the configuration portion of steps 3a through 3k on router R3

Step 4: Configure enhanced username password security.

- a. To create local database entry encrypted to level 4 (SHA256), use the **username *name* secret *password*** global configuration command. In global configuration mode, enter the following command:

```
R1(config)# username JR-ADMIN secret class12345
R1(config)# username ADMIN secret class54321
```

- b. Set the console line to use the locally defined login accounts.

```
R1(config)# line console 0
R1(config-line)# login local
R1(config-line)# exit
```

```
R1(config)#
```

c. Set the vty lines to use the locally defined login accounts.

```
R1(config)# line vty 0 4
R1(config-line)# login local
R1(config-line)# end
R1(config)#
```

```
R1(config-line)#login local
R1(config-line)#end
R1#
*Mar 1 01:26:45.199: %SYS-5-CONFIG_I: Configured from console
R1#
```

```

R3(config-line)#end
R3#
*Mar 1 01:29:48.311: %SYS-5-CONFIG_I: Configured from console
R3#
```

d. Repeat the steps 4a to 4c on R3.

e. To verify the configuration, telnet to R3 from R1 and login using the ADMIN local database account.

```
R1# telnet 10.2.2.2
```

```
R1#conf t
Enter configuration commands, one per line. End with CNTL/Z
R1(config)#username JR-ADMIN secret class12345
R1(config)#username ADMIN secret class54321
R1(config)#line console 0
R1(config-line)#login local
R1(config-line)#exit
R1(config)#line vty 0 4
R1(config-line)#login local
R1(config-line)#end
R1#
*Mar 1 01:26:45.199: %SYS-5-CONFIG_I: Configured from console
R1#telnet 10.2.2.2
Trying 10.2.2.2 ... Open
Unauthorized access strictly prohibited!

User Access Verification

Username: ADMIN
Password: R3>
```

Step 5: Enabling secure remote management using SSH.

a. SSH requires that a device name and a domain name be configured. Since the router already has a name assigned, configure the domain name.

```
R1(config)# ip domain-name ccnasecurity.com
```

- b. The router uses the RSA key pair for authentication and encryption of transmitted SSH data. Although optional it may be wise to erase any existing key pairs on the router.

```
R1(config)# crypto key zeroize rsa
```

- c. Generate the RSA encryption key pair for the router. Configure the RSA keys with 1024 for the number of modulus bits.

```
R1(config)# crypto key generate rsa general-keys modulus 1024
```

- d. Cisco routers support two versions of SSH:

- **SSH version 1 (SSHv1)**: Original version but has known vulnerabilities.
- **SSH version 2 (SSHv2)**: Provides better security using the Diffie-Hellman key exchange and the strong integrity-checking message authentication code (MAC).

```
R1(config)# ip ssh version 2
```

```
R1(config)#
```

- e. Configure the vty lines to use only SSH connections.

```
R1(config)# line vty 0 4
R1(config-line)# transport input ssh
R1(config-line)# end
```

```
R1(config)#ip ssh version 2
R1(config)#line vty 0 4
R1(config-line)#transport input ssh
R1(config-line)#end
R1#
*Mar 1 01:02:32.647: %SYS-5-CONFIG_I: Config
```

- f. Verify the SSH configuration using the show ip ssh command.

```
R1# show ip ssh
```

```
R1#show ip ssh
SSH Enabled - version 2.0
Authentication timeout: 120 secs; Authentication retries: 3
R1#ssh -l ADMIN 10.2.2.2

Password:
% Password: timeout expired!
Password:
% Password: timeout expired!
% Authentication failed.

[Connection to 10.2.2.2 closed by foreign host]
R1#ssh -l ADMIN 10.2.2.2

Password:
Unauthorized access strictly prohibited!
R3>
```

g. Repeat the steps 6a to 6f on R3.

h. Although a user can SSH from a host using the SSH option of TeraTerm or PuTTY, a router can also SSH to another SSH enabled device. SSH to R3 from R1.

R1# ssh -l ADMIN 10.2.2.2

```
Authentication timeout: 120 SECS, Authentication retries: 5
R1#ssh -l ADMIN 10.2.2.2

Password:
% Password: timeout expired!
Password:
% Password: timeout expired!
% Authentication failed.

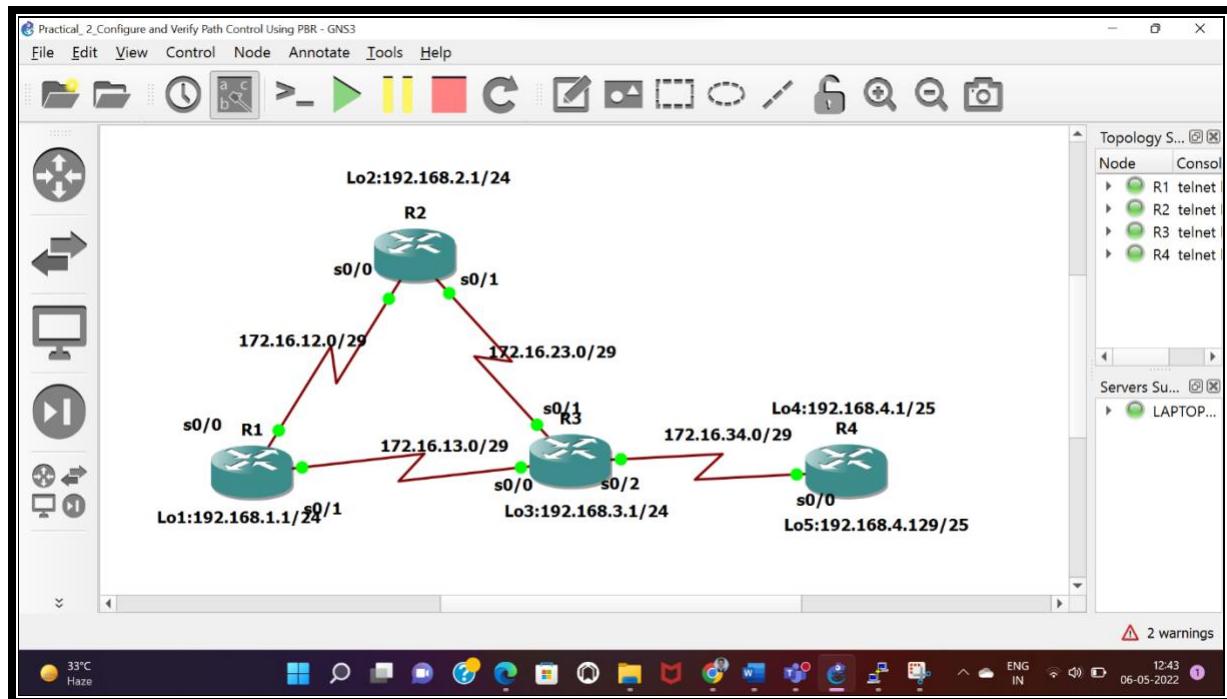

[Connection to 10.2.2.2 closed by foreign host]
R1#ssh -l ADMIN 10.2.2.2

Password:
Unauthorized access strictly prohibited!
R3>
```

Practical No – 5

Aim: Configure and Verify Path Control Using PBR.

Topology :

Objectives

- Configure and verify policy-based routing.
- Select the required tools and commands to configure policy-based routing operations.
- Verify the configuration and operation by using the proper show and debug commands.

Required Resources

- 4 routers (Cisco IOS Release 15.2 or comparable)
- Serial and Ethernet cables

Step 1: Configure loopbacks and assign addresses.

- Cable the network as shown in the topology diagram. Erase the startup configuration, and reload each router to clear previous configurations.
- Using the addressing scheme in the diagram, create the loopback interfaces and apply IP addresses to these and the serial interfaces on R1, R2, R3, and R4.

Router R1

```
hostname R1
!
interface Lo1
  description R1 LAN
  ip address 192.168.1.1 255.255.255.0
!
```

```

interface Serial0/0
description R1 --> R2
ip address 172.16.12.1 255.255.255.248
clock rate 128000
bandwidth 128
no shutdown
!
interface Serial0/1
description R1 --> R3
ip address 172.16.13.1 255.255.255.248
bandwidth 64
no shutdown
!
End

```

```

R1(config-if)#end

```

- c. Verify the configuration with the show ip interface brief, show protocols, and show interfaces description commands. The output from router R3 is shown here as an example.

R3# show ip interface brief | include up

Interface	IP-Address	OK?	Method	Status	Protocol
FastEthernet0/0	unassigned	YES	unset	administratively down	down
Serial1/0	172.16.13.3	YES	manual	up	up
Serial1/1	172.16.23.3	YES	manual	up	up
Serial1/2	172.16.34.3	YES	manual	up	up
Serial1/3	unassigned	YES	unset	administratively down	down
Loopback3	192.168.3.1	YES	manual	up	up

R3# show protocols

```

R3#show protocols
Global values:
  Internet Protocol routing is enabled
FastEthernet0/0 is administratively down, line protocol is down
  Serial1/0 is up, line protocol is up
    Internet address is 172.16.13.3/29
Serial1/1 is up, line protocol is up
  Internet address is 172.16.23.3/29
Serial1/2 is up, line protocol is up
  Internet address is 172.16.34.3/29
Serial1/3 is administratively down, line protocol is down
Loopback3 is up, line protocol is up
  Internet address is 192.168.3.1/24

```

```
R3# show interfaces description | include up
```

Interface	Status	Protocol Description
Fa0/0	admin down	down
Se1/0	up	up
Se1/1	up	up
Se1/2	up	up
Se1/3	admin down	down

Step 3: Configure basic EIGRP

- Implement EIGRP AS 1 over the serial and loopback interfaces as you have configured it for the other EIGRP labs.
- Advertise networks 172.16.12.0/29, 172.16.13.0/29, 172.16.23.0/29, 172.16.34.0/29, 192.168.1.0/24, 192.168.2.0/24, 192.168.3.0/24, and 192.168.4.0/24 from their respective routers.

Router R1

```
router eigrp 1
network 192.168.1.0
network 172.16.12.0 0.0.0.7
network 172.16.13.0 0.0.0.7
no auto-summary
```

```
R1(config)#router eigrp 1
R1(config-router)#network 192.168.1.0
R1(config-router)#network 172.16.12.0 0.0.0.7
R1(config-router)#network 172.16.13.0 0.0.0.7
R1(config-router)#no auto-summary
```

Router R2

```
router eigrp 1
network 192.168.2.0
network 172.16.12.0 0.0.0.7
network 172.16.23.0 0.0.0.7
no auto-summary
```

```
R2(config)#router eigrp 1
R2(config-router)#network 192.168.2.0
R2(config-router)#network 172.16.12.0 0.0.0.7
R2(config-router)#network 172.16.23.0 0.0.0.7
R2(config-router)#no auto-summary
```

Router R3

```
router eigrp 1
network 192.168.3.0
network 172.16.13.0 0.0.0.7
network 172.16.23.0 0.0.0.7
network 172.16.34.0 0.0.0.7
no auto-summary
```

```
R3(config)#router eigrp 1
R3(config-router)#network 192.168.3.0
R3(config-router)#network 172.16.13.0 0.0.0.7
R3(config-router)#network 172.16.23.0 0.0.0.7
R3(config-router)#network 172.16.34.0 0.0.0.7
R3(config-router)#no auto-summary
```

Router R4

```
router eigrp 1
network 192.168.4.0
network 172.16.34.0 0.0.0.7
no auto-summary
```

```
R4(config)#router eigrp 1
R4(config-router)#network 192.168.4.0
R4(config-router)#network 172.16.34.0 0.0.0.7
R4(config-router)#no auto-summary
```

Step 4: Verify EIGRP connectivity.

- Verify the configuration by using the show ip eigrp neighbors command to check which routers have EIGRP adjacencies.

R1# show ip eigrp neighbors

IP-EIGRP neighbors for process 1							
H	Address	Interface	Hold (sec)	Uptime (ms)	SRTT (ms)	RTO Cnt	Q Seq Num
1	172.16.13.3	Se1/1	11	00:00:31	26	200 0	18
0	172.16.12.2	Se1/0	12	00:00:44	37	222 0	13

R2# show ip eigrp neighbors

IP-EIGRP neighbors for process 1							
H	Address	Interface	Hold (sec)	Uptime (ms)	SRTT (ms)	RTO Cnt	Q Seq Num
1	172.16.23.3	Se1/1	11	00:00:50	41	246 0	20
0	172.16.12.1	Se1/0	11	00:01:04	30	200 0	18

R3# show ip eigrp neighbors

IP-EIGRP neighbors for process 1							
H	Address	Interface	Hold (sec)	Uptime (ms)	SRTT (ms)	RTO Cnt	Q Seq Num
2	172.16.34.4	Se1/2	12	00:00:44	48	288 0	6
1	172.16.23.2	Se1/1	11	00:00:58	26	200 0	19
0	172.16.13.1	Se1/0	12	00:00:58	281	1686 0	20

R4# show ip eigrp neighbors

```
R4#show ip eigrp neighbors
IP-EIGRP neighbors for process 1
H   Address           Interface      Hold Uptime    SRTT    RTO  Q  Seq
     (sec)          (ms)          Cnt Num
0   172.16.34.3       Se1/0          10 00:00:55  23   200  0  26
R4#
```

- b. Run the following Tcl script on all routers to verify full connectivity.

R1# tclsh

```
foreach address {
172.16.12.1
172.16.12.2
172.16.13.1
172.16.13.3
172.16.23.2
172.16.23.3
172.16.34.3
172.16.34.4
192.168.1.1
192.168.2.1
192.168.3.1
192.168.4.1
192.168.4.129
} { ping $address }
```

```
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.12.1, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 44/61/76 ms
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.12.2, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 16/27/40 ms
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.13.1, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 40/58/80 ms
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.13.3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 20/31/44 ms
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.23.2, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 20/28/32 ms
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.16.23.3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 24/40/48 ms
Type escape sequence to abort.
```

Step 5: Verify the current path.

- a. On R1, use the show ip route command. Notice the next-hop IP address for all networks discovered by EIGRP.

R1# show ip route | begin Gateway

```

R1#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
      E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS le
      ia - IS-IS inter area, * - candidate default, U - per-user stati
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      172.16.0.0/29 is subnetted, 4 subnets
D        172.16.34.0 [90/2681856] via 172.16.13.3, 00:01:50, Serial1/1
D        172.16.23.0 [90/2681856] via 172.16.13.3, 00:01:50, Serial1/1
                  [90/2681856] via 172.16.12.2, 00:01:50, Serial1/0
C        172.16.12.0 is directly connected, Serial1/0
C        172.16.13.0 is directly connected, Serial1/1
D        192.168.4.0/24 [90/2809856] via 172.16.13.3, 00:01:38, Serial1/1
C        192.168.1.0/24 is directly connected, Loopback1
D        192.168.2.0/24 [90/2297856] via 172.16.12.2, 00:01:50, Serial1/0
D        192.168.3.0/24 [90/2297856] via 172.16.13.3, 00:01:50, Serial1/1

```

- b. On R4, use the traceroute command to the R1 LAN address and source the ICMP packet from R4 LAN A and LAN B.

```
R4# traceroute 192.168.1.1 source 192.168.4.1
```

```
R4#traceroute 192.168.1.1 source 192.168.4.1

Type escape sequence to abort.
Tracing the route to 192.168.1.1

 1 172.16.34.3 36 msec 32 msec 32 msec
 2 172.16.13.1 28 msec 56 msec 84 msec
```

```
R4# traceroute 192.168.1.1 source 192.168.4.129
```

```
R4#traceroute 192.168.1.1 source 192.168.4.129

Type escape sequence to abort.
Tracing the route to 192.168.1.1

 1 172.16.34.3 44 msec 28 msec 28 msec
 2 172.16.13.1 64 msec 28 msec 64 msec
```

- c. On R3, use the show ip route command and note that the preferred route from R3 to R1 LAN 192.168.1.0/24 is via R2 using the R3 exit interface S0/0/1.

```
R3# show ip route | begin Gateway
```

```
R3#show ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
      E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
      ia - IS-IS inter area, * - candidate default, U - per-user static
      o - ODR, P - periodic downloaded static route
```

```
172.16.0.0/29 is subnetted, 4 subnets
C    172.16.34.0 is directly connected, Serial1/2
C    172.16.23.0 is directly connected, Serial1/1
D    172.16.12.0 [90/2681856] via 172.16.23.2, 00:02:29, Serial1/1
                  [90/2681856] via 172.16.13.1, 00:02:29, Serial1/0
C    172.16.13.0 is directly connected, Serial1/0
D    192.168.4.0/24 [90/2297856] via 172.16.34.4, 00:02:17, Serial1/2
D    192.168.1.0/24 [90/2297856] via 172.16.13.1, 00:02:29, Serial1/0
D    192.168.2.0/24 [90/2297856] via 172.16.23.2, 00:02:29, Serial1/1
C    192.168.3.0/24 is directly connected, Loopback3
```

- d. On R3, use the show interfaces serial 0/0/0 and show interfaces s0/0/1 commands.

R3# show interfaces serial0/0

```
R3#show int s1/0
Serial1/0 is up, line protocol is up
  Hardware is M4T
  Internet address is 172.16.13.3/29
  MTU 1500 bytes, BW 1544 Kbit/sec, DLY 20000 usec,
  Routing Descriptor Blocks:
    172.16.13.1 (Serial1/0), from 172.16.13.1, Send flag is 0x0
      Composite metric is (2297856/128256), Route is Internal
      Vector metric:
        Minimum bandwidth is 1544 Kbit
        Total delay is 25000 microseconds
        Reliability is 255/255
        Load is 1/255
        Minimum MTU is 1500
        Hop count is 1
    172.16.23.2 (Serial1/1), from 172.16.23.2, Send flag is 0x0
```

R3# show interfaces serial0/0 | include BW

R3# show interfaces serial0/1 | include BW

- e. Confirm that R3 has a valid route to reach R1 from its serial 0/0/0 interface using the show ip eigrp topology 192.168.1.0 command.

R3# show ip eigrp topology 192.168.1.0

```

R3#show ip eigrp topology 192.168.1.0
IP-EIGRP (AS 1): Topology entry for 192.168.1.0/24
  State is Passive, Query origin flag is 1, 1 Successor(s), FD is
  Routing Descriptor Blocks:
    172.16.13.1 (Serial1/0), from 172.16.13.1, Send flag is 0x0
      Composite metric is (2297856/128256), Route is Internal
      Vector metric:
        Minimum bandwidth is 1544 Kbit
        Total delay is 25000 microseconds
        Reliability is 255/255
        Load is 1/255
        Minimum MTU is 1500
        Hop count is 1
    172.16.23.2 (Serial1/1), from 172.16.23.2, Send flag is 0x0

```

Step 6: Configure PBR to provide path control.

- a. On router R3, create a standard access list called PBR-ACL to identify the R4 LAN B network.

```

R3(config)# ip access-list standard PBR-ACL
R3(config-std-nacl)# remark ACL matches R4 LAN B traffic
R3(config-std-nacl)# permit 192.168.4.128 0.0.0.127
R3(config-std-nacl)# exit
R3(config)#

```

- b. Create a route map called R3-to-R1 that matches PBR-ACL and sets the next-hop interface to the R1 serial 0/0/1 interface.

```

R3(config)# route-map R3-to-R1 permit
R3(config-route-map)# description RM to forward LAN B traffic to R1
R3(config-route-map)# match ip address PBR-ACL
R3(config-route-map)# set ip next-hop 172.16.13.1
R3(config-route-map)# exit
R3(config)#

```

- c. Apply the R3-to-R1 route map to the serial interface on R3 that receives the traffic from R4. Use the ip policy route-map command on interface S0/1/0.

```

R3(config)# interface s0/0
R3(config-if)# ip policy route-map R3-to-R1
R3(config-if)# end
R3#

```

- d. On R3, display the policy and matches using the show route-map command.

```
R3# show route-map
```

```

*Mar 1 00:31:30.507: IP: s=192.168.4.129 (Serial0/0), d=192.168.1.1, l
FIB policy rejected - normal forwarding
*Mar 1 00:31:30.507: IP: s=192.168.4.129 (Serial0/0), d=192.168.1.1, l

257
*Mar 1 00:31:30.507: IP: s=192.168.4.129 (Serial0/0), d=192.168.1.1, l
FIB policy rejected - normal forwarding
R3#
R3#show route-map
route-map R3-to-R1, permit, sequence 10
  Match clauses:
    ip address (access-lists): PBR-ACL
  Set clauses:
    ip next-hop 172.16.13.1
Policy routing matches: 6 packets, 192 bytes
R3#

```

Step 7: Test the policy.

- On R3, create a standard ACL which identifies all of the R4 LANs.**

```

R3# conf t
Enter configuration commands, one per line. End with CNTL/Z.
R3(config)# access-list 1 permit 192.168.4.0 0.0.0.255
R3(config)# exit

```

- Enable PBR debugging only for traffic that matches the R4 LANs.**

```

R3# debug ip policy ?
R3# debug ip policy 1

```

- Test the policy from R4 with the traceroute command, using R4 LAN A as the source network.**

```
R4# traceroute 192.168.1.1 source 192.168.4.1
```

- Test the policy from R4 with the traceroute command, using R4 LAN B as the source network.**

```
R4# traceroute 192.168.1.1 source 192.168.4.129
```

- On R3, display the policy and matches using the show route-map command.**

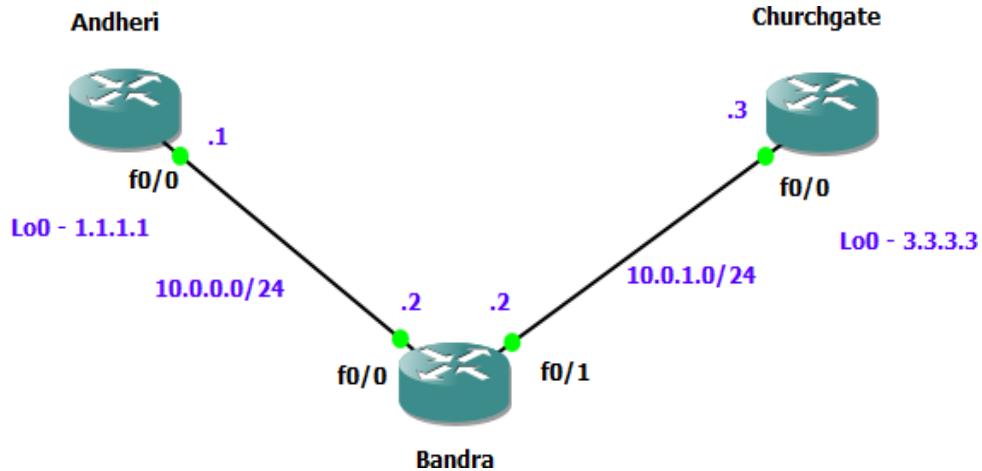

```
R3# show route-map
```

```
R3# FIB policy match

Policy routing matches: 6 packets, 192 bytes
R3#
```

Practical 6

Aim: Cisco MPLS Configuration.

Topology:

Step 1 – IP addressing of MPLS Core and OSPF

First bring 3 routers into your **Topology** R1, R2, R3 position them as below. We are going to address the routers and configure ospf to ensure loopback to loopback connectivity between R1 and R3

```
Andheri(config)#int lo0
Andheri(config-if)#ip add 1.1.1.1 255.255.255.255
Andheri(config-if)#ip ospf 1 area 0
Andheri(config-if)#
Andheri(config-if)#int f0/0
Andheri(config-if)#ip add 10.0.0.1 255.255.255.0
Andheri(config-if)#no shut
Andheri(config-if)#ip ospf 1 area 0
```

```

Bandra(config)#int lo0
Bandra(config-if)#
Bandra(config-if)#ip add 2.2.2.2 255.255.255.255
Bandra(config-if)#ip ospf 1 area 0
Bandra(config-if)#
Bandra(config-if)#int f0/0
Bandra(config-if)#ip add 10.0.0.2 255.255.255.0
Bandra(config-if)#no shut
Bandra(config-if)#ip ospf 1 area 0
Bandra(config-if)#
Bandra(config-if)#int f0/1
Bandra(config-if)#ip add 10.0.1.2 255.255.255.0
Bandra(config-if)#no shut
Bandra(config-if)#ip ospf 1 area 0

```

```

Churchgate(config)#int lo0
Churchgate(config-if)#ip add 3.3.3.3 255.255.255.255
Churchgate(config-if)#ip ospf 1 area 0
Churchgate(config-if)#
Churchgate(config-if)#int f0/0
Churchgate(config-if)#ip add 10.0.1.3 255.255.255.0
Churchgate(config-if)#no shut
Churchgate(config-if)#ip ospf 1 area 0

```

You should now have full ip connectivity between R1, R2, R3 to verify this we need to see if we can ping between the loopbacks of R1 and R3

```

Andheri#ping 3.3.3.3 source lo0
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 3.3.3.3, timeout is 2 seconds:
Packet sent with a source address of 1.1.1.1
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 20/52/64 ms

```

Step 2 – Configure LDP on all the interfaces in the MPLS Core

In order to run MPLS you need to enable it, there are two ways to do this.

At each interface enter the mpls ip command

Under the ospf process use the mpls ldp autoconfig command

```

Andheri(config)#router ospf 1
Andheri(config-router)#mpls ldp autoconfig

Bandra(config)#router ospf 1
Bandra(config-router)#mpls ldp autoconfig

Churchgate(config)#router ospf 1
Churchgate(config-router)#mpls ldp autoconfig

```

You should see log messages coming up showing the LDP neighbors are up.

```

Bandra#
*May 29 17:03:09.559: %SYS-5-CONFIG_I: Configured from console by console
Bandra#
*May 29 17:03:28.631: %LDP-5-NBRCHG: LDP Neighbor 3.3.3.3:0 (2) is UP

```

To verify the mpls interfaces the command is very simple – sh mpls interface

This is done on R2 and you can see that both interfaces are running mpls and using LDP

```
Bandra#sh mpls int
Interface          IP           Tunnel   BGP Static Operational
FastEthernet0/0    Yes (ldp)    No        No  No      Yes
FastEthernet0/1    Yes (ldp)    No        No  No      Yes
Bandra#
```

You can also verify the LDP neighbors with the sh mpls ldp neighbors command.

```
Bandra#sh mpls ldp neigh
Peer LDP Ident: 1.1.1.1:0; Local LDP Ident 2.2.2.2:0
  TCP connection: 1.1.1.1.646 - 2.2.2.2.25712
  State: Oper; Msgs sent/rcvd: 9/9; Downstream
  Up time: 00:01:23
  LDP discovery sources:
    FastEthernet0/0, Src IP addr: 10.0.0.1
  Addresses bound to peer LDP Ident:
    10.0.0.1      1.1.1.1
Peer LDP Ident: 3.3.3.3:0; Local LDP Ident 2.2.2.2:0
  TCP connection: 3.3.3.3.50470 - 2.2.2.2.646
  State: Oper; Msgs sent/rcvd: 8/8; Downstream
  Up time: 00:00:54
  LDP discovery sources:
    FastEthernet0/1, Src IP addr: 10.0.1.3
  Addresses bound to peer LDP Ident:
    10.0.1.3      3.3.3.3
```

One more verification to confirm LDP is running ok is to do a trace between R1 and R3 and verify if you get MPLS Labels show up in the trace.

```
Andheri#trace 3.3.3.3
Type escape sequence to abort.
Tracing the route to 3.3.3.3
1 10.0.0.2 [MPLS: Label 17 Exp 0] 20 msec 60 msec 60 msec
2 10.0.1.3 60 msec 60 msec 60 msec
```

Step 3 – MPLS BGP Configuration between R1 and R3

We need to establish a Multi Protocol BGP session between R1 and R3 this is done by configuring the vpng4 address family as below

```
Andheri(config)#router bgp 1
Andheri(config-router)#neighbor 3.3.3.3 remote-as 1
Andheri(config-router)#neighbor 3.3.3.3 update-source Loopback0
Andheri(config-router)#no auto-summary
Andheri(config-router)#
Andheri(config-router)#address-family vpng4
Andheri(config-router-af)#neighbor 3.3.3.3 activate
Churchgate(config)#router bgp 1
Churchgate(config-router)#neighbor 1.1.1.1 remote-as 1
Churchgate(config-router)#neighbor 1.1.1.1
*May 29 17:06:19.459: %BGP-5-ADJCHANGE: neighbor 1.1.1.1 Up
Churchgate(config-router)#neighbor 1.1.1.1 update-source loopback 0
Churchgate(config-router)#no auto-summary
Churchgate(config-router)#address-family vpng4
Churchgate(config-router-af)#neighbor 1.1.1.1 activate
```

To verify the BGP session between R1 and R3 issue the command sh bgp vpng4 unicast all summary

```

Andheri#sh bgp vpng4 unicast all summary
BGP router identifier 1.1.1.1, local AS number 1
BGP table version is 1, main routing table version 1

Neighbor      V      AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
3.3.3.3        4      1      5      6      1      0      0      0 00:00:30          0

```

Step 4 – Add two more routers, create VRFs

We will add two more routers into the **Topology** so it now looks like the final **Topology**

```

Borivali(config)#int lo0
Borivali(config-if)#ip ad
*May 29 17:13:47.223: %LINEPROTO-5-UPDOWN: Line protocol o
Borivali(config-if)#ip address 4.4.4.4 255.255.255.255
Borivali(config-if)#ip ospf 2 area 2
Borivali(config-if)#int f0/0
Borivali(config-if)#ip addresss 192.168.1.4 255.255.255.0
^
% Invalid input detected at '^' marker.

Borivali(config-if)#ip address 192.168.1.4 255.255.255.0
Borivali(config-if)#ip ospf 2 area 2
Borivali(config-if)#no shut

```

```

Andheri(config)#int f0/1
Andheri(config-if)#no shut
Andheri(config-if)#ip address
*May 29 17:14:16.199: %LINK-3-UPDOWN: Interface FastEther
*May 29 17:14:17.199: %LINEPROTO-5-UPDOWN: Line protocol o
Andheri(config-if)#ip address 192.168.1.1 255.255.255.0

```

```

Andheri(config-if)#ip vrf RED
Andheri(config-vrf)#rd 4:4
Andheri(config-vrf)#route-target both 4:4

```

```

Andheri(config-vrf)#int f0/1
Andheri(config-if)#ip vrf forwarding RED
% Interface FastEthernet0/1 IP address 192.168.1.1 removed due to enabling VRF RED

```

```

Andheri#sh run int f0/1
Building configuration...

Current configuration : 119 bytes
!
interface FastEthernet0/1
 ip vrf forwarding RED
 ip address 192.168.1.1 255.255.255.0
 duplex auto
 speed auto
end

```

If you issue the command sh ip route this shows the routes in the global table and you will notice that you do not see 192.168.1.0/24

```

Andheri#sh ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area

      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      6.0.0.0/32 is subnetted, 1 subnets
O          6.6.6.6 [110/2] via 192.168.2.6, 00:01:10, FastEthernet0/1
C          192.168.2.0/24 is directly connected, FastEthernet0/1

```

Ok so we have come a long way now let's review the current situation. We now have this setup

```

Borivali#sh ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
      E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
      ia - IS-IS inter area, * - candidate default, U - per-user subnet route
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

      4.0.0.0/32 is subnetted, 1 subnets
C          4.4.4.4 is directly connected, Loopback0
C          192.168.1.0/24 is directly connected, FastEthernet0/0

```

As expected we have the local interface and the loopback address. When we are done we want to see 6.6.6.6 in there so we can ping across the MPLS Check the routes on R1

```
Andheri#sh ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP

```

```
Churchgate(config)#router bgp 1
Churchgate(config-router)#address-family ipv4 vrf RED
Churchgate(config-router-af)#redistribute ospf 2
Churchgate(config-router-af)#end
```

```
Andheri(config)#router bgp 1
Andheri(config-router)#address-family ipv4 vrf RED
Andheri(config-router-af)#redistribute ospf 2
Andheri(config-router-af)#exit
Andheri(config-router)#end
```

```

Andheri#sh ip bgp vpng4 vrf RED
BGP table version is 9, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop           Metric LocPrf Weight Path
Route Distinguisher: 4:4 (default for vrf RED)
* > 4.4.4.4/32        192.168.1.4            2       32768 ??
* >i6.6.6.6/32        3.3.3.3              2       100     0 ?
* > 192.168.1.0        0.0.0.0              0       32768 ??
* >i192.168.2.0        3.3.3.3              0       100     0 ??

```

```

Churchgate#sh ip bgp vpng4 vrf RED
BGP table version is 9, local router ID is 3.3.3.3
Status codes: s suppressed, d damped, h history, * valid, > best,
               r RIB-failure, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

      Network          Next Hop           Metric LocPrf Weight Path
Route Distinguisher: 4:4 (default for vrf RED)
*>i4.4.4.4/32        1.1.1.1              2       100     0 ?
*> 6.6.6.6/32        192.168.2.6            2       32768 ??
*>i192.168.1.0        1.1.1.1              0       100     0 ?
*> 192.168.2.0        0.0.0.0              0       32768 ??

```

Which it is! 6.6.6.6 is now in the BGP table in VRF RED on R3 with a next hop of 192.168.2.6 (R6) and also 4.4.4 is in there as well with a next hop of 1.1.1.1 (which is the loopback of R1 – showing that it is going over the MPLS and R2 is not in the picture)

```

Andheri(config)#router ospf 2
Andheri(config-router)#redistribute bgp 1 subnets

Churchgate(config)#router ospf 2
Churchgate(config-router)#redistribute bgp 1 subnets

```

Before we do let's see what the routing table look like on R4

```

Borivali#sh ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static
       o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

        4.0.0.0/32 is subnetted, 1 subnets
C          4.4.4.4 is directly connected, Loopback0
        6.0.0.0/32 is subnetted, 1 subnets
O IA      6.6.6.6 [110/3] via 192.168.1.1, 00:00:50, FastEthernet0/0
C          192.168.1.0/24 is directly connected, FastEthernet0/0
O IA 192.168.2.0/24 [110/2] via 192.168.1.1, 00:00:50, FastEthernet0/0

```

Do the same step of on R6

```
Mahim#sh ip route
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
      E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS lev
      ia - IS-IS inter area, * - candidate default, U - per-user static
      o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

        4.0.0.0/32 is subnetted, 1 subnets
O IA    4.4.4.4 [110/3] via 192.168.2.1, 00:00:22, FastEthernet0/0
      6.0.0.0/32 is subnetted, 1 subnets
C       6.6.6.6 is directly connected, Loopback0
O IA 192.168.1.0/24 [110/2] via 192.168.2.1, 00:00:22, FastEthernet0/0
C     192.168.2.0/24 is directly connected, FastEthernet0/0
```

Lets check ping command

```
Borivali#ping 6.6.6.6
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 6.6.6.6, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 112/120/128 ms
```

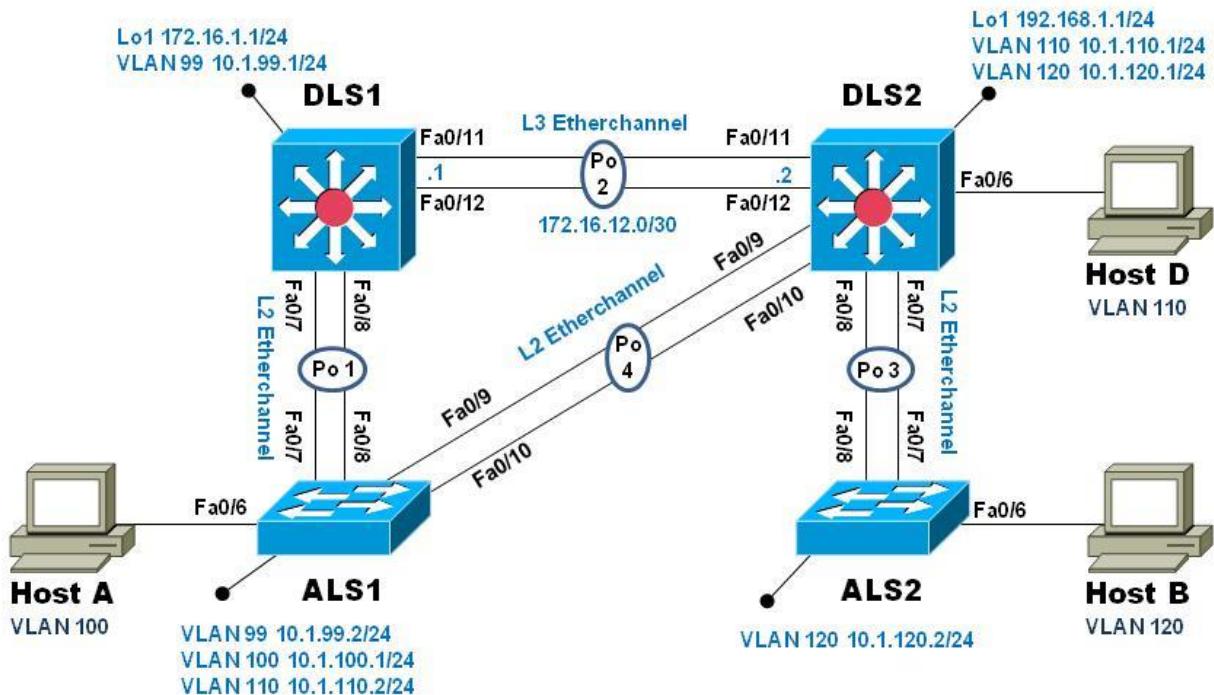

Which we can – to prove this is going over the mpls and be label switched and not routed, let do a trace

```
Borivali#trace 6.6.6.6
Type escape sequence to abort.
Tracing the route to 6.6.6.6

1 192.168.1.1 20 msec 32 msec 24 msec
2 10.0.0.2 [MPLS: Labels 17/19 Exp 0] 112 msec 136 msec 124 msec
3 192.168.2.1 [MPLS: Label 19 Exp 0] 72 msec 92 msec 92 msec
4 192.168.2.6 140 msec 124 msec 124 msec
```

Practical 7

Aim: Inter-VLAN Routing
Topology:

Objectives:

- Implement a Layer 3 EtherChannel
- Implement Static Routing
- Implement Inter-VLAN Routing
- Configure Multilayer Switching using Distribution Layer Switches
- Load base config
- Use the reset.tcl script you created in Lab 1 “Preparing the Switch” to set your switches up for this lab. Then load the file BASE.CFG into the running-config with the command **copy flash:BASE.CFG running-config**. An example from DLS1:

DLS1# **tclsh reset.tcl**

Erasing the nvram filesystem will remove all configuration files! Continue? [confirm]
[OK]

Erase of nvram: complete

Reloading the switch in 1 minute, type reload cancel to halt

Proceed with reload? [confirm]

*Mar 7 18:41:40.403: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram

*Mar 7 18:41:41.141: %SYS-5-RELOAD: Reload requested by console. Reload Reason:
Reload command.

<switch reloads - output omitted>

Would you like to enter the initial configuration dialog? [yes/no]: n

Switch> **en**

*Mar 1 00:01:30.915: %LINK-5-CHANGED: Interface Vlan1, changed state to administratively down

Switch# **copy BASE.CFG running-config**

```
Destination filename [running-config]?
184 bytes copied in 0.310 secs (594 bytes/sec)
DLS1#
```

Verify switch management database configuration

At each switch, use the show sdm prefer command to verify the appropriate template is chosen. The DLS switches should be using the "dual ipv4-and-ipv6 routing" template and the ALS switches should be using the "lanbase-routing" template. If any of the switches are using the wrong template, make the necessary change and reboot the switch with the **reload** command. An example from ALS1 is below:

```
ALS1# sho sdm pref
```

The current template is "default" template.

<output omitted>

```
ALS1# conf t
```

Enter configuration commands, one per line. End with CNTL/Z.

```
ALS1(config)# sdm pref lanbase-routing
```

Changes to the running SDM preferences have been stored, but cannot take effect until the next reload.

Use 'show sdm prefer' to see what SDM preference is currently active.

```
ALS1(config)# end
```

```
ALS1# reload
```

System configuration has been modified. Save? [yes/no]: **y**

*Mar 1 02:12:00.699: %SYS-5-CONFIG_I: Configured from console by console

Building configuration...

[OK]

Proceed with reload? [confirm]

Configure layer 3 interfaces on the DLS switches

Enable IP Routing, create broadcast domains (VLANs), and configure the DLS switches with the layer 3 interfaces and addresses shown:

Switch	Interface	Address/Mask
DLS1	VLAN 99	10.1.99.1/24
DLS1	Loopback 1	172.16.1.1/24
DLS2	VLAN 110	10.1.110.1/24
DLS2	VLAN 120	10.1.120.1/24
DLS2	Loopback 1	192.168.2.1/24

An example from DLS2:

```
DLS2(config)# ip routing
DLS2(config)# vlan 110
DLS2(config-vlan)# name Management
DLS2(config-vlan)# exit
DLS2(config)# vlan 120
DLS2(config-vlan)# name Local
DLS2(config-vlan)# exit
DLS2(config)# int vlan 110
DLS2(config-if)# ip address 10.1.110.1 255.255.255.0
```

```

DLS2(config-if)# no shut
DLS2(config-if)# exit
DLS2(config)# int vlan 120
DLS2(config-if)# ip address 10.1.120.1 255.255.255.0
DLS2(config-if)# no shut
DLS2(config-if)# exit
DLS2(config)# int loopback 1
DLS2(config-if)# ip address 192.168.1.1 255.255.255.0
DLS2(config-if)# no shut
DLS2(config-if)# exit
DLS2(config)#

```

At this point, basic intervlan routing can be demonstrated using an attached host. Host D is attached to DLS2 via interface Fa0/6. On DLS2, assign interface Fa0/6 to VLAN 110 and configure the host with the address 10.1.110.50/24 and default gateway of 10.1.110.1. Once you have done that, try and ping Loopback 1's IP address (192.168.1.1). This should work just like a hardware router; the switch will provide connectivity between two directly connected interfaces. In the output below, the **switchport host** macro was used to quickly configure interface Fa0/6 with host-relative commands:

```

DLS2(config)# int f0/6
DLS2(config-if)# switchport host
switchport mode will be set to access
spanning-tree portfast will be enabled
channel group will be disabled

DLS2(config-if)# switchport access vlan 110
DLS2(config-if)# no shut
DLS2(config-if)# exit
DLS2(config)#

```

The screenshot shows a Windows command prompt window titled "Windows IP Configuration". It displays the configuration for the "Ethernet adapter Local Area Connection". The adapter has a Connection-specific DNS Suffix of ".", a Link-local IPv6 Address of fe80::59a7:56ce:f785:ed46%11, and an IPv4 Address of 10.1.110.50. The Subnet Mask is 255.255.255.0 and the Default Gateway is 10.1.110.1. Below this, a "Ping" command is run from the prompt C:\Users\student> to 192.168.1.1. The ping statistics show 4 packets sent, 4 received, 0 lost, and 0% loss. Approximate round trip times are given as Minimum = 1ms, Maximum = 2ms, and Average = 1ms.

```

C:\Windows\system32\cmd.exe
Windows IP Configuration

Reply from 192.168.1.1: bytes=32 time=1ms TTL=255

Ping statistics for 192.168.1.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 1ms, Maximum = 2ms, Average = 1ms

C:\Users\student>

```

Configure a Layer 3 Etherchannel between DLS1 and DLS2
Now you will interconnect the multilayer switches in preparation to demonstrate other routing capabilities. Configure a layer 3 EtherChannel between the DLS switches. This will

provide the benefit of increased available bandwidth between the two multilayer switches. To convert the links from layer 2 to layer 3, issue the **no switchport** command. Then, combine interfaces F0/11 and F0/12 into a single PAgP EtherChannel and then assign an IP address as shown.

DLS1	172.16.12.1/30	DLS2	172.16.12.2/30
------	----------------	------	----------------

Example from DLS1:

```
DLS1(config)# interface range f0/11-12
DLS1(config-if-range)# no switchport
DLS1(config-if-range)# channel-group 2 mode desirable
Creating a port-channel interface Port-channel 2
```

```
DLS1(config-if-range)# no shut
DLS1(config-if-range)# exit
DLS1(config)# interface port-channel 2
DLS1(config-if)# ip address 172.16.12.1 255.255.255.252
DLS1(config-if)# no shut
DLS1(config-if)# exit
DLS1(config)#
```

Once you have configured both sides, verify that the EtherChannel link is up

```
DLS2# show etherchannel summary
Flags: D - down      P - bundled in port-channel
I - stand-alone s - suspended
H - Hot-standby (LACP only)
R - Layer3    S - Layer2
U - in use     f - failed to allocate aggregator
```

```
M - not in use, minimum links not met
u - unsuitable for bundling
w - waiting to be aggregated
d - default port
```

Number of channel-groups in use: 1

Number of aggregators: 1

Group	Port-channel	Protocol	Ports
2	Po2(RU)	PAgP	Fa0/11(P) Fa0/12(P)

DLS2# ping 172.16.12.1

Type escape sequence to abort.

Sending 5, 100-byte ICMP Echos to 172.16.12.1, timeout is 2 seconds:

.!!!!

Success rate is 80 percent (4/5), round-trip min/avg/max = 1/3/9 ms

DLS2#

Configure default routing between DLS switches

At this point, local routing is support at each distribution layer switch. Now to provide reachability across the layer 3 EtherChannel trunk, configure fully qualified static default routes at DLS1 and DLS2 that point to each other. From DLS1:

```
DLS1(config)# ip route 0.0.0.0 0.0.0.0 port-channel 2
%Default route without gateway, if not a point-to-point interface, may impact
performance
DLS1(config)# ip route 0.0.0.0 0.0.0.0 port-channel 2 172.16.12.2
DLS1(config)#

```

Once done at both ends, verify connectivity by pinging from one switch to the other. In the example below, DLS2 pings the Loopback 1 interface at DLS1.

DLS2# show ip route

Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
<output omitted>

Gateway of last resort is 172.16.12.1 to network 0.0.0.0

```
S* 0.0.0.0/0 [1/0] via 172.16.12.1, Port-channel2
    10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C   10.1.110.0/24 is directly connected, Vlan110
L   10.1.110.1/32 is directly connected, Vlan110
    172.16.0.0/16 is variably subnetted, 2 subnets, 2 masks
C   172.16.12.0/30 is directly connected, Port-channel2
L   172.16.12.2/32 is directly connected, Port-channel2
    192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
C   192.168.1.0/24 is directly connected, Loopback1
L   192.168.1.1/32 is directly connected, Loopback1
```

DLS2# ping 172.16.1.1

Type escape sequence to abort.

Sending 5, 100-byte ICMP Echos to 172.16.1.1, timeout is 2 seconds:

!!!!

Success rate is 100 percent (5/5), round-trip min/avg/max = 1/4/9 ms

DLS2#

Configure the remaining EtherChannels for the topology

Configure the remaining EtherChannel links as layer 2 PagP trunks using VLAN 1 as the native VLAN.

Endpoint 1	Channel number	Endpoint 2	VLANs Allowed
ALS1 F0/7-8	1	DLS1 F0/7-8	All except 110
ALS1 F0/9-10	4	DLS2 F0/9-10	110 Only
ALS2 F0/7-8	3	DLS2 F0/7-8	All

Example from ALS1:

```
ALS1(config)# interface range f0/7-8
ALS1(config-if-range)# switchport mode trunk

ALS1#
```

Enable and Verify Layer 3 connectivity across the network

In this step we will enable basic connectivity from the management VLANs on both sides of the network.

Create the management VLANs (99 at ALS1, 120 at ALS2)

Configure interface VLAN 99 at ALS1 and interface VLAN 120 at ALS2

Assign addresses (refer to the diagram) and default gateways (at DLS1/DLS2 respectively).

Once that is all done, pings across the network should work, flowing across the layer 3 EtherChannel. An example from ALS2:

```
ALS2(config)# vlan 120
ALS2(config-vlan)# name Management
ALS2(config-vlan)# exit
ALS2(config)# int vlan 120
ALS2(config-if)# ip address 10.1.120.2 255.255.255.0
ALS2(config-if)# no shut
ALS2(config-if)# exit
ALS2(config)# ip default-gateway 10.1.120.1
ALS2(config)# end
```

ALS2# ping 10.1.99.2

Type escape sequence to abort.

Sending 5, 100-byte ICMP Echos to 10.1.99.2, timeout is 2 seconds:

...!!!

Success rate is 60 percent (3/5), round-trip min/avg/max = 1/3/8 ms

ALS2#

ALS2# traceroute 10.1.99.2

Type escape sequence to abort.

Tracing the route to 10.1.99.2

VRF info: (vrf in name/id, vrf out name/id)

1 10.1.120.1 0 msec 0 msec 8 msec

2 172.16.12.1 0 msec 0 msec 8 msec

3 10.1.99.2 0 msec 0 msec *

ALS2#

Configure Multilayer Switching at ALS1

At this point all routing is going through the DLS switches, and the port channel between ALS1 and DLS2 is not passing anything but control traffic (BPDUs, etc).

The Cisco 2960 is able to support basic routing when it is using the LANBASE IOS. In this step you will configure ALS1 to support multiple SVIs and configure it for basic static routing. The objectives of this step are:

Enable intervlan routing between two VLANs locally at ALS1

Enable IP Routing

Configure a static route for DLS2's Lo1 network travel via Port-Channel 4.

Configure additional VLANs and VLAN interfaces

At ALS1, create VLAN 100 and VLAN 110 and then create SVIs for those VLANs:

```
ALS1(config)# ip routing
ALS1(config)# vlan 100
ALS1(config-vlan)# name Local
ALS1(config-vlan)# exit
```

```

ALS1(config)# vlan 110
ALS1(config-vlan)# name InterNode
ALS1(config-vlan)# exit
ALS1(config)# int vlan 100
ALS1(config-if)# ip address 10.1.100.1 255.255.255.0
ALS1(config-if)# no shut
ALS1(config-if)# exit
ALS1(config)# int vlan 110
ALS1(config-if)# ip address 10.1.110.2 255.255.255.0
ALS1(config-if)# no shut
ALS1(config-if)# exit
ALS1(config)#

```

Configure and test Host Access

Assign interface Fa0/6 to VLAN 100. On the attached host (Host A) configure the IP address 10.1.100.50/24 with a default gateway of 10.1.100.1. Once configured, try a traceroute from the host to 10.1.99.2 and observe the results.

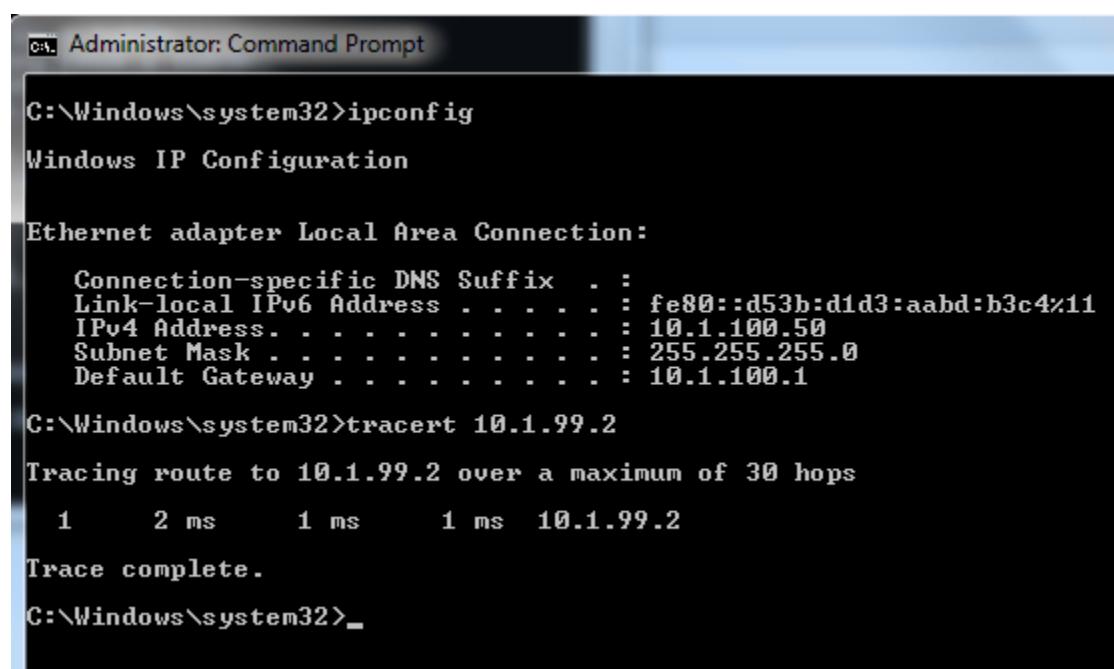

In the output below, the **switchport host** macro was used to quickly configure interface Fa0/6 with host-relative commands.

```

ALS1(config)# interface f0/6
ALS1(config-if)# switchport host
switchport mode will be set to access
spanning-tree portfast will be enabled
channel group will be disabled

ALS1(config-if)# switchport access vlan 100
ALS1(config-if)# no shut
ALS1(config-if)# exit

```

The screenshot shows a Windows Command Prompt window titled "Administrator: Command Prompt". The command `ipconfig` is run, displaying the IP configuration for the "Ethernet adapter Local Area Connection". The output shows the following details:

```

C:\Windows\system32>ipconfig
Windows IP Configuration

Ethernet adapter Local Area Connection:

  Connection-specific DNS Suffix  . :
  Link-local IPv6 Address . . . . . : fe80::d53b:did3:aabd:b3c4%11
  IPv4 Address . . . . . : 10.1.100.50
  Subnet Mask . . . . . : 255.255.255.0
  Default Gateway . . . . . : 10.1.100.1

```

Then, the command `tracert 10.1.99.2` is run, tracing the route to the destination IP address. The output shows the following results:

```

C:\Windows\system32>tracert 10.1.99.2
Tracing route to 10.1.99.2 over a maximum of 30 hops
  1    2 ms     1 ms     1 ms  10.1.99.2
Trace complete.
C:\Windows\system32>_

```

The output from the host shows that attempts to communicate with interface VLAN 99 at ALS1 were fulfilled locally, and not sent to DLS1 for routing.

Configure and verify static routing across the network

At this point, local routing (at ALS1) works, and off-net routing (outside of ALS1) will not work, because DLS1 doesn't have any knowledge of the 10.1.100.0 subnet. In this step you will configure routing on several different switches:

At DLS1, configure:

a static route to the 10.1.100.0/24 network via VLAN 99

At DLS2, configure

a static route to the 10.1.100.0/24 network via VLAN 110

At ALS1, configure

a static route to the 192.168.1.0/24 network via VLAN 110

a default static route to use 10.1.99.1

Here is an example from ALS1:

```
ALS1(config)# ip route 192.168.1.0 255.255.255.0 vlan 110
```

```
ALS1(config)# ip route 0.0.0.0 0.0.0.0 10.1.99.1
```

```
ALS1(config)# end
```

```
ALS1# show ip route
```

Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP

D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area

N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2

E1 - OSPF external type 1, E2 - OSPF external type 2

i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2

ia - IS-IS inter area, * - candidate default, U - per-user static route

o - ODR, P - periodic downloaded static route, H - NHRP, l - LISP

+ - replicated route, % - next hop override

Gateway of last resort is 10.1.99.1 to network 0.0.0.0

S* 0.0.0.0/0 [1/0] via 10.1.99.1

10.0.0.0/8 is variably subnetted, 6 subnets, 2 masks

C 10.1.99.0/24 is directly connected, Vlan99

L 10.1.99.2/32 is directly connected, Vlan99

C 10.1.100.0/24 is directly connected, Vlan100

L 10.1.100.1/32 is directly connected, Vlan100

C 10.1.110.0/24 is directly connected, Vlan110

L 10.1.110.2/32 is directly connected, Vlan110

S 192.168.1.0/24 is directly connected, Vlan110

After configuring all of the required routes, test to see that the network behaves as expected.

From ALS1, a traceroute to 10.1.120.2 should take three hops:

```
ALS1# traceroute 10.1.120.2
```

Type escape sequence to abort.

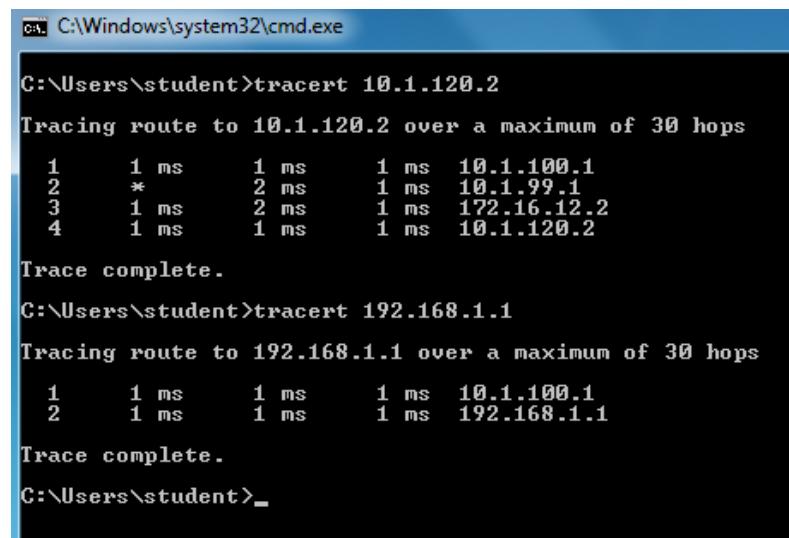

Tracing the route to 10.1.120.2

```
VRF info: (vrf in name/id, vrf out name/id)
 1 10.1.99.1 0 msec 0 msec 0 msec
 2 172.16.12.2 9 msec 0 msec 0 msec
 3 10.1.120.2 0 msec 8 msec *
ALS1#
```

From ALS1, a traceroute to 192.168.1.1 should take one hop:

```
ALS1# traceroute 192.168.1.1
Type escape sequence to abort.
Tracing the route to 192.168.1.1
VRF info: (vrf in name/id, vrf out name/id)
 1 10.1.110.1 0 msec 0 msec *
ALS1#
```

Traces from Host A show an additional hop, but follow the appointed path:

```
C:\Windows\system32\cmd.exe
C:\Users\student>tracert 10.1.120.2
Tracing route to 10.1.120.2 over a maximum of 30 hops
 1      1 ms      1 ms      1 ms  10.1.100.1
 2      *         2 ms      1 ms  10.1.99.1
 3      1 ms      2 ms      1 ms  172.16.12.2
 4      1 ms      1 ms      1 ms  10.1.120.2

Trace complete.

C:\Users\student>tracert 192.168.1.1
Tracing route to 192.168.1.1 over a maximum of 30 hops
 1      1 ms      1 ms      1 ms  10.1.100.1
 2      1 ms      1 ms      1 ms  192.168.1.1

Trace complete.

C:\Users\student>_
```

End of Lab

Save your configurations. The switches will be used as configured now for lab 5-2, DHCP.
